Arrangement of Abstracts

See Appendix I for definition of 'Major' and 'Minor' Countries.

'MAJOR' COUNTRIES – An alerting abstract of every basic and examined equivalent document is provided except for equivalents from Canada, East Germany and Switzerland. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

See inside cover for further details.

A	Polymer Chemistry
A+	Polymer Applns.
AE	Polymer & General Chemistry
B	Pharmaceuticals

Copies of Specifications may be ordered from our PATENTS SUPPLY DIVISION.

EUROPEAN PATENTS REPORT
PCT PATENTS REPORT

New publications in the World Patents Abstracts service provide detailed, documentation-type abstracts, with drawings, of **all EPO and PCT** applications within **14 days** of publication. Also reported with the **designated states**, and references cited in the **international search report.**

Annual subscription costs :—
European Patents Report : £250, $525 or Y 95,000
PCT Patents Report : £100, $210 or Y 38,000

As support documentation the abstracts and complete specifications are available on **microfilm.**
Descriptive brochures giving complete price list, and specimen copies, are available on request from the Subscription Department.

D1: FOOD; FERMENTATION

D11 : BAKING

OHN/ ★ D11 37356B/20 ★DT 2750-358
utomatic mfr. of crackers - by mixing leaven separate from bread ough under specified temp. conditions
HOHN K 08.11.77-DT-750358
(10.05.79) A21d-13

Crackers are mfd. from leaven, prepd. from flour and water, mixed in a ratio of 1:8 at a water tem. of 75-95°C cooling to 35°C and storing at 20-50°C for 70 h. The baking dough is made of flour and water at a ratio of 0.8:1 with the addition of leaven and other additives at a rate of <1 wt %. The dough is cooled to <12°C before baking it to crackers.

The low water content makes this pastry infinitely durable. It has an excellent mild bread taste, remains always crisp, yet causes no discomfort to denture wearers. 8.11.77 as 750358 (13pp49)

BAKP D11 40063A/22 =GB 1545-739
Food processing oven with oil ribbon burners - preheated by hot air then gas to reach oil vaporising temperature
BAKER PERKINS INC 26.11.76-US-745077
*+Q32 Q73 (16.05.79) *US4083-353 +B65d-05/72*

A food processing oven includes an assembly of fuel/air burners for heating the oven chamber, whose products of combustion will at least partly enter the chamber. The burners are supplied by a minor connected to lines for gas oil and hot air.

The gas and oil lines have control devices which prevent supply to the mixer until a predetermined temp. is reached at which they will burn satifactorily. The oven may be used for bakery products and prevents contamination by the products of incomplete combustion. 21.11.77 as 048184 (10pp1379)

D12 : MEAT; FISH PROCESSING

RANG- D12 85848A/47 #BE -871-993
Appts. for transporting frankfurter casings - with vacuum to pull casings to diverter disc for disposal
RANGER TOOL CO INC 29.06.77-US-811186 (14.11.78-BE-871993)
*+Q35 (14.05.79) *US4124-919 A22c +B65g*

Casings peeled from cooked frankfurters are transported to a disposal site using a vacuum source. A conduit has a first end at the vacuum source and a second end near to the station where the casings are peeled from the frankfurters. The vacuum source pulls the casings through the conduit.

A diverter is positioned above a station where the casings are finally to be deposited. The diverter blocks the conduit for the casings. It includes first and second portions for sequential alignment with the conduit. Pref. the diverter comprises a disc which is apertured to allow the vacuum to extend through it but to prevent the passage of the casings. The disc is rotatable across the path followed by the casings.

The appts. is used to convey discarded casings from cooked frankfurters to a remote disposal station. The use of the appts. replaces a process which involves several handling stages for the discarded casings. 14.11.78 as 871993 (20pp295)

ARMO D12 15301S/08 =DS 1692-573
Self basting poultry products
ARMOUR CO 01.10.65-US-492319
*(10.05.79) *US3563-763 +A23l-01/31*

Treatment of raw, oven-ready poultry, comprises injecting layers of edible fat in the muscle tissues at several places of the bird's bodies. The process prevents the flesh from drying out during roasting, giving high quality products. 30.9.66 as 692573 (7pp047).

STEM- D12 67864V/39 =DS 2342-985
Delicatessen products with preservative coatings of uniform thickness - applied with solvent vapour retained in treating area and then exhaused to atmosphere
STEMMLER M AND H GMBH 25.08.73-DT-342985
*(10.05.79) *BE-814-611 A23b-04/10*

A system to apply a coating, dissolved in a volatile organic solvent, to meat products and sausages by dipping employs an enclosed container which can be filled and drain-
for all process stages. The soln. is extd. from the container after the dipping operation and the wetted articles are left in the container atmosphere which is enriched with solvent vapours. After these vapours have been extd. the articles are dried by air blasts.

Method avoids contamination of the work place by vapours and gives a uniform coating. 25.8.73 as 342985 (6pp39).

UNIL D12 58765V/33 =DS 2404-610
Meat products mfr. - by finely mincing to destroy fibre structure and addn. of consolidated protein fibre
UNILEVER NV 31.01.73-GB-004838
*(10.05.79) *DT2404-610 A23j-03 A23l-01/31*

Much of the muscular meat of slaughtered animals which is less suitable for consumption due to a high content of tough connective tissue is restructured by extrusion through many small holes. The strands are cut up by reciprocating blades into short pieces which still hang together but are easily broken up at the planes of weakness. The strands are broken up into fingers or granules after a heat-induced solidification.

The meat product is very eatable and digestible, and suitable for pasties or dehydrated soup mixes. 31.1.74 as 404610 (5pp39).

LANG/ ★ D12 37245B/20 ★DT 2747-908
Animal carcass refrigeration system - with precooling tunnel and refrigeration at off/peak periods
LANG O 26.10.77-DT-747908
(10.05.79) A23b-04/06

The animal carcasses are first passed through a tunnel with controlled temps. (10-20°C) and humidity for a controlled time before they pass into the deep freeze chambers. Beef carcasses are deep frozen only after rigor mortis, at off-peak periods at night. Pig carcasses are not only precooled in the tunnel but also deep frozen.

This saves electric power costs. There is less difficulty with ice formation on the evaporators which has to be de-icded. The meat quality is not impaired by too rapid cooling before rigor mortis. 26.10.77 as 747908 (8pp39)

STIB ★ D12 37312B/20 ★DT 2749-667
Steak preparation attachment for domestic appliance - with one driven and one idle spiked roller
STIEBEL WERKE GMBH 05.11.77-DT-749667
(10.05.79) A22c-09

An attachment for a domestic appliance to prepare a slice of meat as steak is a housing with an inlet shaft and an outlet shaft. One of a pair of spiked rollers is driven by the appliance shaft. The other is idle and is pressed by a spring against the first.

This saves the manual spiking of the slices of meat. 5.11.77 as 749667 (8pp39)

UNIC ★ D12 37518B/20 ★EP ---1-867
Peelable cellulosic casing for food prods. - has internal coating of water-soluble cellulose ether and cationic thermosetting resin or edible protein
UNION CARBIDE CORP 03.11.77-US-848065
A97 (A11 A21 A23) (16.05.79) A22c-13
D/S: E(BE, CH, DT, FR, GB, NL, SW).

A cellulosic food casing has an internal coating comprising a water-soluble cellulose ether (I) with either a cationic thermosetting resin (II) or a water-soluble protein (III). (II) may be water-soluble or dispersible and may be curable to a water-insoluble state. When (II) is used, the coating may also comprise a mineral oil, polyol or water-soluble alkylene oxide adduct of partial fatty acid ester. Casing may be reinforced with a fibrous web and is pref. shirred.

Used in the processing of snack goods. The cellulose casing is cheaper than collagen casings, adheres well to the encased food mass and can be readily stripped using automatic equipment. The peeled food prods. do not have an undesirable level of surface grease.

1.1178 as 200281 (35pp949).
(E) ISR: US3905397; FR2141324; US3378379; FR2224088; FR2163623; BE396414; US3360383; GB1175919.

DANE- ★ D12 37608B/20 ★GB 1546-196
Inserting sepg. sheet between bacon slices - by separating slices on jump and accelerating conveyors then inserting sheet
DANEPAK LTD 26.10.76-GB-044353
Q36 (16.05.79) B65h-39/02

Appts. for inserting a carrier sheet beneath slices of a food esp. bacon is located adjacent a slicing machine. Bacon slices fall onto a jump conveyor which is temporarily accelerated as each slice is received to increase the separation between slices. Slices are then transferred to a second conveyor having a higher linear speed to further increase the separation between slices and this conveyor discharges the slices onto a third conveyor. The third conveyor is supplied with individual sheets of separator sheet in synchronism with the arrival of the bacon slices so that each slice falls onto a sheet and the pair is removed for subsequent packing. The separator sheet may be card, paper or platics and is printed in a decorative fashion. A shingle of separated bacon slices is packaged in a transparent envelope and the decorative sheets enhances the saleability of the package. 28.11.77 (7pp295)

MACL/ ★ D12 37610B/20 ★GB 2007-077
Mycelial meat analogues and extenders - prepd. by aerobic culture of amylolytic fungi esp. Rhizopus) on moist starch
MACLENNAN M E 08.11.77-AU-002345
(D16) (16.05.79) A23j-03 A23l-01/28

Protein-contg. material (I) is prepd. as follows: (a) a starch-based material (II) (which may be an N-source(III)) is partially gelatinized in the presence of H_2O to a substrate of max. overall particle size $\leqslant$ 3 mm; (b) (III) is added if necessary without altering the physical characteristics of the substrate; (c) the substrate is inoculated with one or more non-toxic amylolytic fungal strains; (d) the mixt. is incubated in the presence of O_2 and H_2O until most of the substrate particles and/or degradation prods. are closely bound by a network of mycelia; (e.g. the prod. is denatured to afford (I).

(II) is assimilable by the fungal spp. used; is par
has max. overall particles size $<$ 2.5 mm.; and is
in a total amt. which is non-inhibitory, but which al
adequate growth in step (d).

When dried or minced, etc., (I) has the appeara
texture such that it may be used as an extender or s
ute for meat. 7.11.78 as 043483 (10pp478)

UHLK- ★ D12 38281B/20 ★NL 7
Device for supplying cooled drinking water to meat process
combined cooler and storage vessel as one compact unit
GEB UHL GMBH 28.10.77-DT-U33277
(02.05.79) A22c-05

Cooled potable water is supplied to a meat processin
-hine from a combined cooler and storage device co
ing a cooler unit fed via the fresh water feed pipe an
cooled water storage vessel. Both components are e
with temp. and level sensing devices, from which sig
are transmitted to a controlled which regulates the f
cooled water to the process and fresh water to the c
as well as the cooler itself. The device is pref. cons
as one unit mounted over the processor.

The device enables the cooled water to be continu
fed to the meat processing plant and eliminates the n
for ice storage. 27.10.78 as 010732 (7pp1370)

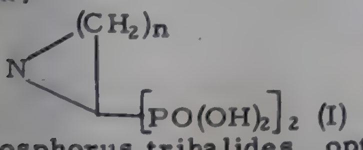
acycloalkane-2,2-diphosphonic acids of formula (I) are
w.



(I)

In (I), n is 3-5 and R is H or 1-3C alkyl. Prepn. of acids (I) and their salts comprises react-
ion of corresp. lactams with
osphorus trihalides, opt. in the presence of H_3PO_3, fol-
wed by hydrolysis and opt. salt formation.
The prods. are sequestering agents for polyvalent ions
d are used in complexing agents, washing and cleansing
aids, as stabilisers for peroxy cpds., or in dental and pharmaceutical prepns. 27. 8. 73 as 343196 (7pp047).

CARL- D13 61268Y/35 =DS 2648-296
Mould fastener for continuous chocolate moulding machine - uses spring loaded clamps for automatic changing of moulds
CARLE & MONTANARI 12.07.76-IT-025215
*(10.05.79) *BE-854-098 A23g-01/22*

The casting plates of a chocolate casting machine are moved along by two parallel chains which slide on guide rails. The holding elements of the chains which slide on inside L-shaped guides are bars of rectangular section with recesses for engaging correspondingly profiled ledges on the casting plates. The holding elements can slide on pins, fixed to the chains, at right angles to the direction of motion and are held in position by springs.

This facilitates an automatic change of the casting plates; the plates will not become detached when tapped to free the mouldings. 26. 10. 76 as 648296 (7pp39).

PFIZ D13 25058Y/14 =DS 2659-459
Citric acid by aerobic Candida fermentation in slack wax media - which also contains a solubilising agent, e.g. n-decane
PFIZER INC 03.03.76-US-663347
*B05 E17 H04 (10.05.79) *US4014-742 C12d-01/04*

The prodn. of citric acid comprises aerobic propagation of Candida aerob species in a.q. media contg. suitable nutrients. After > 50% of the available C source has been consumed, paraffin residues (1 pt. wt.) and a solubilising agent (0.25-2 pts. wt.) are introduced, followed by 4-10C alkanols, lower esters of 2-6C alkanoic acids, 8-19C alkanes or alkenes, turpentine, mineral oil or their mixts.

After propagation is complete, citric acid is recovered from the ferment. 30. 12. 76 as 659459 (5pp047).

TOYJ D13 59683Y/34 =DS 2704-545
Pure phosphoric acid prodn. - by treating extracted phosphoric acid with barium cpds. to precipitate sulphate ions

Additive for cattle feeding supplement is an acidified fat (A) made by treatment with an acid at $\geqslant$104°C. Pref. an inorganic acid is used at $\geqslant$1 wt % on the fat (which may be of animal or vegetable origin) and the treated prod. has pH 4-7.

Also new are supplements contg. (A) esp. at $\geqslant$1.5 wt % opt. together with 1-20 wt % meat meal, 0.1-5 wt % $(NH_4)_2HPO_4$ and 0.1-5 wt % $(NH_4/_2SO_4$. They may also include 1 cereal prod. at up to 22 wt %.

(A) reduces consumption of the supplement by cattle so allows it to be given freely without the need for special metering equipment, and without the risk of excessive con-sumption. 7. 11. 78 as 848152 (23pp1251)

Instant coffee prodn - where gas blower foams in first and second zones followed by freeze drying

GENERAL FOODS CORP 05.08.70-GB-037888

*(21.04.79) *DT2139-021 A23f-01/08 +A23l-01 A23l-02/08 B01d-01/18*

Pressurised N_2 is injected into a flow of concentrated coffee extract in a first mixing zone and then led to a second zone where plates spaced apart form paths for a coarse foam product. A second zone with plates designed in a ring and perforated produces the fine foam product with low bilk density. The blower has inlets for gas and liq. and first plates 0.254-2.54 mm thick and spaced by the same amt.

Foam product is easily spray dried, has no included gas bubbles, is light in wt. with low density, with attractive appearance and good flavour. 5.8.71 as 059293 (clg. 5.8.70-GB-037888) B01d-1/18, A23f-1/08, A231-1/00, 2/08 (21.4.79) GENERAL FOODS LTD (6pp)(J4 7005263)

Prodn. of di:sodium phosphate with reduced moisture content - from phosphoric acid and sodium carbonate including specified gas stream drying, useful as intermediate and in food and animal feed compsns.

LENGD BASIC CHEM 03.08.76-SU-391414

C03 E34 (02.06.78) C01b-25/30

Phosphoric acid is neutralised with a sodium cpd. with heating, and the sodium phosphate is obtd. by drying the reaction prod. in a stream of hot gas.

The efficiency of the drying process can be increased and the content of water in the prod. reduced if the neutralisation process is effected with soda at 95-105°C to give a pH of 7.3-7.9, and the gas used for drying is at a temp. of 600-650°C.

The modified method results in a moisture removal rate of 7.5 kg/m³ hr., and gives a prod. contg. only 0.5% moisture, and the deposition level is greatly reduced. The disodium phosphate can be used in prodn. of feedstuffs and as an intermediate.

*A91 E16 (01.05.79) *DT2718-649 C02b-01/42*

Metal ions are selectively eliminated from soln. (I) by contacting (I) with a solid chelate resin having chelating carboxylic anion gps. neutralised with basic amino acid cation prior to contact with (I). The resin reacts with the metal ion to absorb the metal ion from soln.

Pref. chelate resin has a chelating gp. of formula $-N\left[(CH_2)_nCO_2^-.AH^+\right]_mR_{2-m}$ (where AH^+ is basic amino acid cation, R is H or alkyl, m is integer of 1 or 2 and n is integer of 1-4). The process is useful for removing heavy metals, Al, etc. with high efficiency. 25.4.77 as 790744 (9pp924)

Dilute solutions prodn. control, e.g. in the automatic equipment for making marinades in the preserves industry is suitable for dilution of concentrated solutions. A portion of the concentrated solution is mixed with a solvent, while the feed of both constituents to a proportionator is varied. Manufacturing precision is increased by measuring the values of the produced specific gravity of the concentrated solution at the level in the proportionator and the value of the specific content of dissolved substance, to determine the dose needed of the concentrated solution. The sum of these values is calculated, and multiplied by a constant factor. As the signals reach equality the supply of concentrated solution to the proportionator is cut off.

*+Q24 Q42 (10.05.79) *DT2357-707 C02c-01/26*

A system for the treatment of sewage consists of a circular outer basin which is open at both ends and has flexible walls which float on surface waters. Flexible webs connect the walls to the walls of a concentric settling chamber, also made of a flexible material. This chamber has a conical bottom with a raised cone in the centre, above which a vertical distributor pipe is situated.

The sewage enters the outer basin where compressed air can be introduced to aerate it. A pipe directs it to the central distributor pipe. Sludge is deposited in the annular conical bottom and clarified water is discharged by an overflow. This effects an efficient clarification before discharge into river or tidal waters. 19.11.73 as 357707 (4pp39).

Sewage treatment plant - using activated sludge and two aeration stages
UNION CARBIDE CORP 02.04.73-US-347398
*(10.05.79) *BE-801-758 C02c-01/06*

Effluent water is treated with gas contg. > 50 vol. % O_2 for two-stage biological oxidation in the presence of activated sludge. The liq. from the water and sludge is contacted with the gas in an enclosed first gasing zone in which one of the two media is circulated. The partially oxidised liq. and O_2-impoverished gas are transferred to a second enclosed gasing zone separately from each other, where they are continuously mixed with each other and one of the media is circulated. Liq. removed from the second zone is sepd. into clarified water and activated sludge in a clarification zone, and at least part of the sludge recycled to the first gasing zone.

The clarification zone is arcuate, with an arc length of 90-330°. The liq. from the second gasing zone is fed radially through the clarification zone directed from the inner arced boundary of small radius of curvature to the outer arced boundary of larger radius of curvature concentric with the first, which has a spill-over edge to allow water to separate from the sludge.

The velocity of liq. flow through the clarification zone is defined by the equation $\frac{V_E}{V_I} = \left(\frac{Q}{Q+R}\right)\left(\frac{R_1}{R_2}\right) = 0.25-0.70$,
where V_E = radial velocity of liq. at the outer spill over edge, V_I = radial velocity of liq. at the inner arced boundary. Q = volume per unit time of liq. overflow out of the clarification zone, R = vol. per unit time of activated sludge recycled from the clarification zone to the first gasing zone, R_1 = radius of curvature of the inner arc, and R_2 = radius of curvature of the spill-over edge. 6.4.73 as 365749 Div. ex 2317356 (10pp913).

(10.05.79) C02c-01/06

A two-stage biological sewage treatment system reduces in the first stage the organic and in the second stage the inorganic contaminants. Oxygen or a high-oxygen gas is introduced in the second stage and the high-oxygen outflow is directed into the first stage. The outflow, extracted from the second stage, is so dimensioned that the oxygen demand of the first stage is covered.

This ensures a reliable nitrification of the sewage without major engineering efforts. 3.11.77 as 749265 (9pp39)

KUBL- ★ D15 37340B/20 ★DT 2750-028

Sewage sludge filter press system - with starting phase at quarter final pressure and press phases in pressure steps

FA KUBLER H 09.11.77-DT-750028

(10.05.79) C02c-03

In a multi-frame filter press operation, for sewage sludge the pressure threshold in the starting phase rises to 25% of the final figure. The following phase in which sludge is added to the press chambers comprises ten or more press cycles, the pressure is raised in steps to the final threshold. Subsequent to the starting phase, the press chamber pressure is allowed to drop to slightly above ambient.

The result is a filter cake with a much higher solids content (50%) and greater strength. The overall operating costs are less than with conventional filter press systems. 9.11.77 as 750028 (52pp39)

large vessel with multiple level detection and automatic run/
mixed acid and alkaline effluents through dolomite bed**

ADV WATER SERVICES 09.11.77-GB-046655

J02 (10.05.79) B01f-15/04

System is for treatment of a controlled volume of a fi
liquid (esp. an acidic liquor) with a controlled volume
second liquid (esp. an alkaline liquor). This is carri
out in vessel into which the liquids are admitted using
-el detection probes mounted at various levels in the
sel to control the quantities admitted. Agitation is pr
ed by means an air inuection pipe. There is an outlet
valve controlling run off.

The level detection system initiates agitation when
various levels are reached. It also opens the outlet va
when the cycle is complete. The agitation is commen
once all the first liquid has been added and the second
being added. The run off flows through a dolomite bed
remove residual alkanity. System is esp. for use with
water demineralisation plants. 9.11.78 as 848688 (14

Clarification of waste liquid and sludge - by upflow through filter bed with backwashing without draining incompletely settled sludge

PARNABY D 21.05.75-GB-021945

J01 (16.05.79) B01d-29/08

A filtering appts. comprises a tank with a perforate support for a filter bed spaced above the bottom of the tank which has a sludge outlet. It is positioned beneath a weir over which clarified liquor flows into a trough.

Liquor-borne sludge is admitted through a conduit and then flows upwardly through the filter bed, the sludge settling on the tank bottom while the clarified liquid leaves over the weir. A pressure sensor detects a predetermined resistance to movement of liquor through the filter bed. A paddle rake is positioned in the bottom of the tank. The sensor is operatively connected to a valve venting gas from the tank.

Undue discolouration of the treated liquor is prevented and forced channeling through the filter bed is minimised. 21. 5. 75 as 021945 (4pp295)

Anaerobic digestion of organic wastes - by heating slurry, sepg. in solids and liquids, digesting liquids, sepg. slurry, etc.

AGENCY OF IND SCI TECH 14.09.77-JA-109973

(07.04.79) C02c-01/14

In anaerobic digesting method for organic wastes, e.g. excess activated sludge, wastes from agriculture and liv stock industries, urban refuges, etc., (a) a slurried organic waste is heated at > 60 °C. and pH of < 3.5 or > 8.0; (b) the slurry is sepd. into solid content and liquor conte (c) the liquor content is anaerobically digestal with bacteria under a neutral to weak alkaline condition; (d) the slur is sepd. into digested sludge and liquor; (e) the liquor is further sepd. into solid and treated liquor through an aer bic treatment; (f) part of the treated liquor is contacted with the solid content from (b); (g) the mixt. is sepd. into washed residue and washed liquor; and (h) the washed liquor is added to the organic wastes to be used in (a).

The method digests anaerobically the digestible components in wastes at higher digesting rate and with lower consumption of power. 14.9.77 as 109973 (5pp117)

GNZE ★ D15 37900B/20 ★ J5 4044-35

Treating waste water from dyeing - by decarboxylation prior to oxidn. with hydrogen peroxide

GUNZE KK 12.09.77-JA-110983

(07.04.79) C02c-05/04

The dyeing waste water is pretreated, prior to the treatment involving oxidation by hydrogen peroxide in the presence of iron salt catalyst. The pretreatment comprises decarboxylation by the addition of an inorganic acid, e.g. HCl, sulphuric acid, etc. with a 10 to 20 min. stirring, and at the same time pH is reduced to 2 to 5, (~4).

This method can greatly reduce the amt. of the chemicals, (H_2O_2, $FeSO_4 . 7H_2O$, and $Ca(OH)_2$), which are conventionally used and also greatly reduce the amount of sludge generated, to approx. 1/3, as well as providing high purity treated water. 12.9.77 as 110983 (3pp117)

GNZE ★ D15 37901B/20 ★ J5 4044-353

Treating waste water from dyeing processes - by oxidising with hydrogen peroxide using iron sulphate hepta:hydrate catalyst which is recovered after sludge sepn.

GUNZE KK 12.09.77-JA-110984

(07.04.79) C02c-05/04

Method comprises treating the waste water in an oxidation tank with H_2O_2 and $FeSO_4 . 7H_2O$ catalyst for approx. 1 hr. with stirring and passing the treated water to a sedimentation tank where sludge is formed by the addition of NaOH and a small amt. of high polymer coagulant. The sludge, after being sepd., is treated with a chemical, e.g. hydrochloric acid or sulphuric acid, to dissolve the iron salt catalyst present in the sludge, for recovering the catalyst, either after being incinerated or as it is, while the treated ste water from the sludge sepn. tank is released, after ng neutralised with an inorganic acid, to the outside.

Method reduces the amt. of sludge generated and perts recovery of the iron salt catalyst. 12.9.77 as 110984 p117)

SU- ★ D15 37902B/20 ★J5 4044-356

nitrification of treated human waste liquor - by activated sludge thod, using sedimentation, digestion, denitrification, dimentation and decomposition steps

HOSUI ENGINEERING K (ASAN) 14.09.77-JA-109928

(07.04.79) C02b-01/10 C02c-01/06

e supernatant liquor of the treated human wastes is, in se where there are great amounts of SS components, put a preliminary sedimentation tank (I). The separated quor in (I) is then put in a digestion tank under a condition an ammonia load of 0.2-0.5 kg. N/m^3. day for digestion th the activated sludge recovered at a digesting sediment tion tank.

The digested liquor is then put in a denitrification tank der a condition of inorganic nitrogen load of 0.7-1.1 kg. /m^3. day for denitrification with the activated sludge revered at a denitrifying sedimentation tank. The denitried liquor is then put, after degassing, in a sedimentation nk, and lastly the supernatant liquor separated is put in a mplete decomposition tank to remove nearly all nitrogen aerobic biological treatment, where part of the treated quor is recycled and the rest is discharged.

This method is capable of removing nitrogen present in e treated human wastes liquor to the extent of <3 ppm., ith a treatment efficiency of > 99%. 14.9.77 as 109928 pp117)

HITACHI SHIPBLD ENGG KK 19.09.77-JA-112982

J01 (11.04.79) C02c-05

A waste oil is temporarily stored in a waste oil tank and supplied by a pump to an upper part of a film evaporator. The waste oil falls in the evaporator and is heated to evaporate the water so as to form a steam. The steam is introduced from the upper part of the evaporator to a condenser and recovered as water from the condenser.

The oil sepd. from the waste oil under evapn. is taken out from the lower part of the evaporator and temporarily stored in an oil tank. The oil is supplied to oil burners in a burning furnace by an oil pump as needed, so that it is burned in the furnace to recover the generated heat in a waste heat boiler. A steam generated in the waste heat boiler is supplied as a heating source to the evaporator.

The water and the oil may be continuously and effectively sepd. from the waste oil to recover and reuse the water. The waste oil may be completely treated without using other chemicals and energy. 19.9.77 as 112982 (2pp35)

KUBI ★ D15 38115B/20 ★J5 4045-677

Dewatering of conc. sewage - with addn. of cohesion agent before sepn. of sewage cake from liq.

KUBOTA KK 16.09.77-JA-111812

(11.04.79) B01j-01 C02c-03

A cohesion agent is injected into a conc. sewage and the sewage is transferred under pressure by means of a feed pump directly to a dewatering machine, so that the sewage is dewatered to separate the liquid and a sewage cake. The cohesion agent is injected into the sewage at the front and back of the pump. The need for mixing is eliminated.

Costs and space requirement are reduced. The amt. of cohesion agent injected is reduced because the cohesion agent and the sewage are mixed using the rotary blades of the pump and disturbances due to feed under pressure in pipelines. 16.9.77 as 111812 (2pp35)

ASAH ★ D15 38144B/20 ★J5 4045-962

Waste water treatment - using biochemical (de)nitrification and ion exchange to remove organic materials, nitrogen cpds. and phosphorus cpds.

ASAHI CHEMICAL IND KK 16.09.77-JA-111456

(11.04.79) C02c-01/02

Method comprises (1) adding recycling water from the nitrification step to the waste water to be treated to decompose NO_3-N or NO_2-N by the action of bacteria composed mainly of denitrification bacteria under anaerobic conditions and (2) adding waste effluent used for the regeneration of ion-exchange resin to the treated water obtd. in the above initial denitrification step to convert NH_3-N into NO_3-N or NO_2-N by the action of bacteria composed of nitrification bacteria under aerophilic conditions.

Method further comprises (3) recycling a portion of the treated water obtd. in the above nitrification step to the initial denitrification step, adding an organic carbon source to the remainder and removing NO_3-N or NO_2-N by the action of bacteria composed mainly of denitrification bacteria under anaerobic conditions; (4) adding a coagulant, e.g. Al sulphate etc. to the treated water obtd. in the above denitrification step to remove PO_4-P; (5) contacting the P-removed treated water with an ion-exchange resin to remove NH_4-N; and (6) regenerating the satd. ion-exchange resin with aq. -NaCl soln., and recycling the waste regenerating effluent to the nitrification step. 16.9.77 as 111456 (5pp34)

NAGO- ★ D15 38145B/20 ★J5 4045-963
Biological treatment of waste water contg. phenol(s) - from coking plants, phenolic resin plants, etc., by oxidative degradation using oleobacidium
NAGOYA DAIGAKU-CHO 17.09.77-JA-111874
A21 H09 (11.04.79) C02c-01/02

Phenols-contg. waste water, e.g. discharged from coking plants and phenol resin-producing plant etc., is purified by biological oxidn. degradation by culturing eumycetes belonging to oleobacidium group, i.e. oleobacidium sp. No. 14 in a suitable culture medium, and adding the cultured microorganism to the waste water to be treated, followed by aeration, or adding the activated sludge to the waste water, followed by aeration.

In an example, 300 ug/ml. of phenol (as the carbon source) was initially added to a culture medium comprising 0.5% of NH_4NO_3, 0.25% of KH_2PO_4, 0.1% of $MgSO_4.7H_2O$, 0.01% of NaCl, 10 mg/l. of $FeCl_3.6H_2O$, 10 mg./l. of $CaCl_2.2H_2O$ and 0.01% of yeast extract (pH 6.0), after which the microorganism (oleobacidium eumycetes) was inoculated thereon and cultured at 30°C. Feeding of phenol was carried out portion-wise over a period of 240-264 hrs. until 1700 ug/ml. of phenol had been added in total to the medium. Thus, a microorganism exhibiting excellent phenol-degradation property was obtd. 17.9.77 as 111874 (7pp34)

EBAI ★ D15 38146B/20 ★J5 4045-964
Denitrification of waste water e.g. sewage - involves initial denitrification, nitrification and sec. denitrification steps
EBARA INFILCO KK 17.09.77-JA-111946
(11.04.79) C02c-01/02

In biological denitrification of NH_4-N-contg. organic polluted water, e.g. a sewage by sending in succession the water to be treated to an initial denitrification step, a nitrification step and a sec. denitrification step, and recycling a portion of a nitrification liquor discharged from the nitrification step to the initial denitrification step, the improvement comprises adding a portion of the liquor discharged from the initial denitrification step to the nitrification liquor to be recycled and to the nitrification liquor to be flowed into the sec. denitrification step, so that dissolved oxygen contained in the nitrification liquor is consumed by the action of NH_4-N contained in the liquor discharged from the initial denitrification step. The consumption of BOD components and organic carbon sources, e.g. MeOH etc. is thereby prevented and effective denitrification is possible.

It is pref. to install closed-type retention vessels at points where the liquor discharged from the initial denitrification step is added to the nitrification liquor to be recycled and to the nitrification liquor to be flowed into the sec. denitrification step. 17.9.77 as 111946 (3pp34)

Appts. for obtg. a continuous, substantially particle-free sample of liq. comprises a rotatable member having a liq. wettable surface on a generally continuous periphery. A stream of liq. to be sampled is discharged downwardly onto a portion of the surface. The rotatable member is rotated at a speed sufficient to form a bead of liq. to be sample about the periphery of the member. A portion of the liq. is removed from the member by a blade disposed adjacent the periphery of the member in engagement with the bead.

The appts. may be used in obtg. a continuous sample of liq. for subsequent chemical analysis in municipal water or waste water monitoring systems. 3.8.77 as 21403 C. i.p. 3999945, 4052904 (+28.11.75-US-635981)(-pp1363)

Aeration of waste water - with backflushing by reverse flow of air through water system
CLEVEPAK CORP 22.12.77-US-863587
(01.05.79) B01f-03/04 C02c-05/04

A gas is mixed with a body of waste water by pumping the water beneath its surface through a passage in a mixing chamber from an inlet to an outlet. Gas also enters the passage so that the gas and water are mixed in the passage.

For backflushing, the pumping is ceased and the inlet is connected to a backflush location above the outlet without blocking the outlet. The location must have a lower pressure than the pressure at the outlet. Gas is still allowed to enter the passage and this causes backflow of the water from theoutlet through the inlet to the lower pressure location. This flushes debris from the passage and pump.

The method is used partic. for the aeration of industrial waste or sewage, and for flushing accumulated debris from the submerged system. It is not necessary to shut down the system and drain the holding basin for cleaning the system. 22.12.77 as 863587 (9pp295)

Recombining plasmid for transformation of bacteria - to produce heterologous polypeptide e.g. mammalian hormones
GENENTECH INC 08.11.77-US-849591
*B04 +R16 (16.05.79) *BE-871-782 C07g-07 C12d-13/06 C12k-01/02 G01n-33/16 +C07h-21/04 C12k-03*
D/S: E(BE, CH, DT, FR, GB, LU, NL, SW).

(A) Prodn. of a specific polypeptide (I) comprises expression of a heterologous structural gene for (I) in a recombinant microbial cloning vehicle. The structural gene is in reading phase with a DNA sequence coding for a protein other than (I) so that expression yields a precursor protein comprising both the amino acid sequence of (I) and additional protein contg. a selective cleavage site adjacent (I)'s amino acid sequence.

(B) A recombinant microbial cloning vehicle for the above process comprises a regulon, a structural gene coding for the amino acid sequence of (I), and one or more termination codon(s), wherein a DNA sequence coding for additional protein is interposed between the regulon and termination codon(s) without altering the reading frame of the structural gene.

Pref. the cloning vehicle is a plasmid and the process is used to transform bacterial cultures to enable the bacteria to produce an immunogenic substance comprising a polypeptide hapten and an additional protein sufficiently large to confer immunogenicity on the product of expression and enable antibodies to be raised to it. Alternatively, the bacteria may be enabled to produce a desired polypeptide product (e.g. a mammalian hormone or intermediate such as human pre-pro- or pro-insulin; insulin chains A or B, luteinising hormone, human or bovine growth hormones, ACTH, pancreatic polypeptide or somatostatin) linked to an additional protein from which the desired product may be cleaved.

6.11.78. as 300597 (57pp1251).
(E) ISR: —

GENENTECH INC 08.11.77-US-849691
*B04 +R16 (16.05.79) *BE-871-782 C07h-21/04 C12d-13/06 C12k-01/02*
D/S: E(BE, CH, DT, FR, GB, LU, NL, SW).

(A) A structural gene coding for the microbial expression of a polypeptide (I) is prepd. by (i) preparing a first series of oligodeoxyribonucleotide fragments which, when joined in a proper sequence, yield a DNA coding strand for the amino acid sequence of the polypeptide, (ii) preparing a second series of oligodeoxyribonucleotide fragments which, when joined in proper sequence, yield a DNA strand complementary to the coding strand, (iii) effecting H-bonding between mutually complementary portions of the first and second series fragments to form a double-stranded structure, and (iv) completing the respective strands by ligation. The process is characterised in that (a) the resulting gene codes for the expression of a mammalian polypeptide, (b) at least a majority of the codons in the coding strand are those prefd. for the expression of microbial genomes, and (c) the fragments joined in step (iii) lack complementarity, one with the other, save for fragments adjacent one another in the structural gene.

(B) A recombinant microbial cloning vehicle (plasmid) comprises a first restriction endonuclease recognition site, the structural gene coding as above, and a second restriction endonuclease site.

The plasmid allows transformation of a bacterial host so that the bacteria can express the amino acid sequence of the polypeptide (I) in recoverable form. (I) is esp. mammalian hormone or intermediate e.g. human pre-pro- or pro-insulin; insulin chains A or B; luteinizing

ROUS ★ D16 37557B/20 ★EP ---1-945
polysaccharide extracted from Haemophilus influenzae - with antigenic and immunostimulant properties, for treating respiratory infections, bronchitis, diseases caused by H. influenzae, etc.
ROUSSEL-UCLAF 27.10.77-FR-032416
B04 (16.05.79) A61k-31/71 C12d-13/04
D/S: E(BE, CH, DT, GB, NL, SW).

New polysaccharides (I) are extracted from Haemophilus influenza cells, have an apparent mol. wt. >200,000 and are mainly composed of galactose, glucose and mannose. The polysaccharides may also comprise a small amt. of osamines, partic. as glucosamine. Pref. strains of H. influenza are 52151 and 5481 of the Pasteur Institute.

(I) are prepd. by solid or liq. medium culture of H. influenza, havesting after complete development of the microbial mass, phenolic extn. (pref. at ca 65°C) of the washed cell mass, return of the phenolic phase to an aq. phase to give a crude prod. which is purified then subjected to controlled hydrolysis to remove combined fatty acids to recover (I). Pref. the crude prod. is purified by pptn. of nucleic acids with streptomycin sulphate and the controlled hydrolysis is effected with heating in aq.-organic solvent in the presence of an ion exchange resin.

(I) have antigenic and immunostimulant props., useful e.g. in treatment and prevention of diseases caused b influenzae, respiratory infections, bronchitis, chronic bronchitis, etc. Doses are e.g. 1-100 µg/day perlingu Oral, parenteral or local routes of administration are possible. Toxicity is low c.f. active dose, LD_{50} being 65-110 mg/kg (mouse), and tolerance is good, endotox and pyrogens being eliminated.

PERA/ ★ D16 37573B/20 ★FR 2399
Must sampling attachment for winemaking grapes hopper - extr batch representative sample through mesh panel in hopper wall
PERA D 10.08.77-FR-024654
Q35 R16 (13.04.79) B65g-69/10 C12g-01/02 G01n-01/10 G0 33/14

The hopper is of the type having a bottom section with a sloping wall leading down to an outlet.

Part of the sloping wall is now made of a fine mesh grill. The grill forms the top of a juice chamber on the outside of the sloping wall. The juice chamber has a dr valve at its lowest point. Inside the hopper a mechanica fruit crusher is installed adjacent the grill to expel juic into the chamber. The crusher pref. comprises a rotar shaft with radial blades which just touch the grill during rotation. The blades are pref. made of a flexible material and are fixed to a rigid shaft. The shaft can rotate c tinuously in one direction or be periodically reversed vi an automatic gear.

Used for sampling juice from a batch of grapes so tha quality can be assessed prior to mixing with juice from other batches for a particular wine. The sample obtd. vi the inclined wall mesh grill is more truly representative of the batch than samples taken at the base of the hopper Base-extracted samples tend to represent the softest gra es which were most easily crushed during transport and handling. 10.8.77 as 024654 (11pp448).

NOVO D16 92449X/50 =GB 1545-76
Glucose isomerase prepn. by fermentation in presence of oxygen with glucose xylose or hydrolysed starch as pref. carbon sources
NOVO INDUSTRI A/S 22.07.75-GB-030693
*(D17) (16.05.79) *BE-844-397 +C07g-07/02*

A glucose isomerase prod. is produced by fermentation o a facultative, enzyme-producing microorganism with a supply of O_2 which is growth-limiting; a source of carbon and energy, which is repressing enzyme sythesis, and which is easily converted anaerobically to non-repressing degradation prods., being added in sligh excess.

All other nutrients are added in sufficient amts. the prod. glucose isomerase may be recovered pref. the microorganism used is Bacillus coagulans, esp. a constitutNe and asporogenic mutant strain.

Prods. are used for the isomerisation of fructose to glucose, esp. in syrups contg. a mixt. of sugars. 22.7.75 as 030623 (6pp931)

Fumaric acid is obtd. by sub-surface cultivation of the fungus Fusarium oxysporum 53382 in a nutrient medium contg. sources of carbon, nitrogen and mineral salts. Subsequently, the prod. is separated. In order to improve yield, the nutrient medium comprises (in g/l) glucose 70-100; $NaNO_3$ 7-10; KH_2PO_4 0.1-0.2; $MgSO_4$ $7H_2O$ 0.47-0.53; $FeSO_4.7H_2O$ 0.001-0.002; and KCl 0.47-0.53. The ratio of sodium nitrate to glucose is 1:10.

Microbiological 5-inosinic acid prodn. - using Brevibacterium ammoniagenes strains as high yield producers, useful as foo flavouring agent
IND MICROORG GENET 30.09.76-SU-408841
B02 E11 (D13) (23.06.78) C12d-13/06

5-Inosinic acid (I) is produced by Brevibacterium ammoniagenes in a nutritive medium contg. sources of carbon and nitrogen, mineral salts and a source of growth factor

The yield of (I) is improved by using strains Brevibacterium ammoniagenes VNII genetika 377 and 380. A maize extract and a yeast autolysate are used as sources of the growth factors; the medium also contains glucose. The process is simplified and the cost is reduced. The 5-inosinic acid improves the taste of various food prods.

The above strains can be cultivated in a synthetic medium (in contrast to the kindred known strain Br.ammoniagenes 255-5) in presence of 8-azaguanine. The strain Br ammoniagenes-377 is characterised by lower adenine consumption, and strain 380 accumulates less by-products.

Heat insulating compsn. of saccharide-contg. lime - for applyi
molten steel, giving a lower temp. decrease than acidic
insulators
OKAMURA C 20.09.77-JA-112185
E33 M22 P53 (11.04.79) B22d-07/10 B22d-45

Waste lime used in the refining of the saccharide itsel
contg. a small amt. of saccharide, is applied to the su
face of molten steel, as heat insulating material.

In an example, the waste lime 3 pts. wt. and silicat
(SiO_2 70%, Al_2O_3 15%, K_2O + Na_2O 5.5%) 1 part were m
ed, and dried at 200°C. The resultant heat insulating
erial was pulverised and scattered on the surface of m
steel in a 100 ton ladle, in the amt. 1.5-3.5 kg. per to
steel. The temp. decrease of the molten steel betweer
tapping out and the pouring was 7-14°C. The temp. decrease of the steel covered with the usual acidic heat ir
sulator was >15°C. 20.9.77 as 112185 (3pp8)

Dental plaque prevention compsn. - contains sucrose fatty acid es as active ingredient

YAMANOUCHI PHARM KK 02.08.77-JA-092887

B03 E13 (07.04.79) A61k-07/16 A61k-31/72

Compsn. for preventing dental plaque contains a sucrose fatty acid ester as active ingredient. The compsn. inhib its adherence of bacteria to teeth.

The sucrose fatty acid esters is pref. a sucrose stea ate, sucrose oleate or sucrose palmitate. Pref. amt. o fatty acid moieties in the esters is ≥40%. The compsn. pref. is formulated into toothpaste, mouth-spraying liqs gargles, etc. together with conventional ingredients. 2.8.77 as 092887 (13pp16)

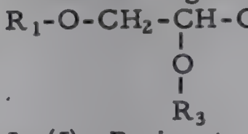
NIHS ★ D21 37879B/20 ★J5 4044-0

Cosmetic compsn. e.g. hair lotion, cream or face mask - cont alkylene oxide adduct of glyceryl ether fatty acid ester) surfactant

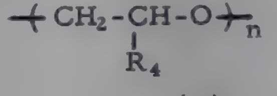
NIPPON SURFACTANT KK 12.09.77-JA-109699

A96 E17 (A25) (07.04.79) A61k-07

The cosmetics contain ≥1 alkylene oxide adduct (I) of glyceryl ether or of a glyceryl ether-fatty acid ester as essential ingredient.



$$R_1\text{-}O\text{-}CH_2\text{-}\underset{\displaystyle \overset{|}{\underset{|}{O}} \atop \displaystyle R_3}{CH}\text{-}CH_2\text{-}O\text{-}R_2 \quad (I)$$



$$\left(CH_2\text{-}\underset{\displaystyle R_4}{\underset{|}{CH}}\text{-}O \right)_n \quad (II)$$

In (I), R_1 is straight or branched> 8C alkyl or alkenyl gp. R_2 is straight or branched > 8C aryl gp. or the same gp. as R_3. R_3 is of formula (II), in which R_4 is H or CH_3 and is 1-100.

(I) are excellent surfactants and (1) are stable to acid, alkali, hydrolysis and pH and are highly preservative, (2) have a lower freezing point than conventional surfactants, such as glyceryl ether, POE-alkyl ether, etc., are convenient to handle and give cosmetics which are stable at low temp., (3) have excellent extending property, (4) dlso act as emollients, (5) give soft touch and can form a protective film on skin, (6) show excellent emulsifying ac ivity and a white fine emulsion can be obtd., (7) are safe and only slightly stimulative to skin and (8) increase the mutual solubility of cosmetic bases.

(I) are combined in an amt. of 1-1.5 w/w% in cosmeti such as hair lotion, hair tonic, lotion, cold cream, hand cream, face mask, etc. 12.9.77 as 109699 (4pp5)

MIMA- ★ D21 37880B/20 ★J5 4044-04

Stable skin cosmetic - prepd. by combining a di:glyceride and/o tri:glyceride contg. branched fatty acid residual gps. in specifie ratio

MIMATSU YUSHI KK 15.09.77-JA-110925

E17 (07.04.79) A61k-07

Cosmetics are prepd. by combining ≥1 of the diglyceride and/or the triglyceride which contains (a) the residual gp. of a branched fatty acid and (b) the residual gp. of ≥1 fatty acids other than the branched fatty acid in the ratio of (a):(b)=2:1, 1:1 or 1:2, in cosmetic base.

The diglyceride or the triglyceride is prepd., e.g. by mixing two or three fatty acids including branched fatty acid and glycerin in the prescribed ratio and esterifying the mixt. in the presence of absence of catalyst. Examples of the diglyceride and triglyceride are isostearo-stearin, isostearo-dipalmitin, isopalmito-isostearo-olein, isostearo-distearin, diisostearo-isopalmitin, isopalmito-diolein, etc.

The cosmetics not only show excellent effects on skin, but alos are stable. The triglyceride or the diglyceride has large molecular space and so stays in liquids, elastic solid or pasty state. It is easily extended on skin to form a protective film which does not inhibit cutaneous respiration and water permeation. It is also excellent in adhesive property to hair and shows excellent hair-setting property without showing corrosive property to celluloid. 15.4.77 as 110925 (5pp5)

MATW ★ D21 37881B/20 ★J5 4044-041

Hair treatment compsn. for curled hair - contains L-ethyl cystine and/or L-methyl cystine and/or their hydrochloride(s)

MATSUSHITA ELEC WORKS 12.09.77-JA-110344

E16 (07.04.79) A61k-07/11

Compsn. (I) for hair-treatment, contains ≥1 of L-ethyl cystine (II), L-methyl cystine (III) and hydrochlorides of (II) and (III).

Pref. amt. of (I) and/or (II) is 1-15 wt.%. The pH of (I) is pref. 6.9-9.5. Reagents for promotion of the reaction, such as urea, monoethanol amine, etc., surfactants and other additives may be added to (I).

(I) is used for curling hair. (I) maintain curls for a long period of time and the brightness and wiry-texture of hair are also maintained. 12.9.77 as 110344 (4pp42)

IGOH/ ★ D21 37882B/20 ★J5 4044-043

Compsn. for masking foul breath - contg. citrus fruit peel. sweetener, flavour and sodium bi:carbonate

IGO H 16.09.77-JA-110533

(07.04.79) A61k-07/16

Compsn. (I) for masking foul breath, is composed of peel of citrus fruit (II), sweetener (III), flavoring cpd. (IV) and sodium bicarbonate (V).

As (I) stimulate stomach and intestines comfortably, appetite increases. The effect for masking foul breath can be maintained for a long time. As (II), orange, lemon, grapefruit and other citrus fruits are used and lemon is the most pref. (III) are lactose, sucrose, maltose, glucose and sugar-alcohol and lactose is the most pref. As (IV), cassia and pepermint are suitable. The wt. ratios of (III)/(II), (IV)/(II) and (V)/(II) should be 1-5. 0.1-0.6 and 0.1-0.6, respectively. Usually (I) is used in powdery state and the amt. of (I) to be dosed at a time is 0.3-0.5g. 16.9.77 as 110533 (4pp42)

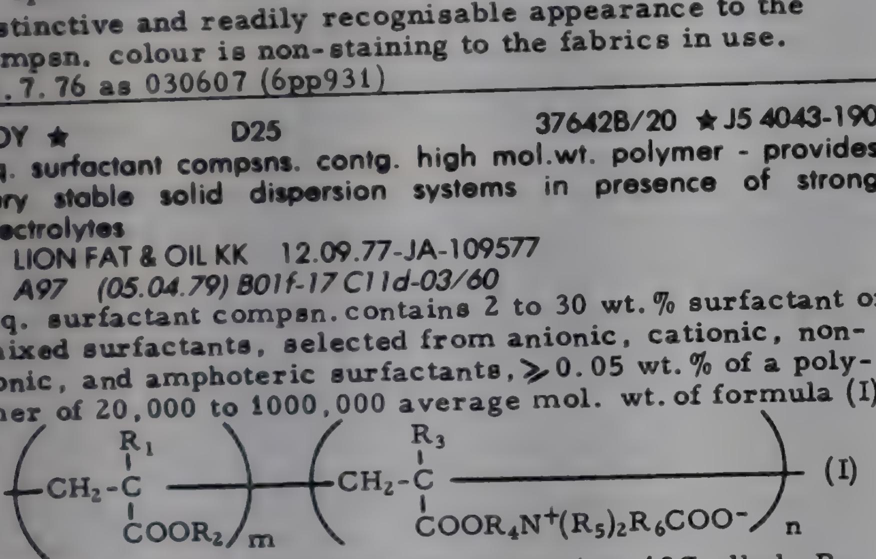
LIOY ★ D25 37642B/20 ★J5 4043-190

Aq. surfactant compsns. contg. high mol.wt. polymer - provides very stable solid dispersion systems in presence of strong electrolytes

LION FAT & OIL KK 12.09.77-JA-109577

A97 (05.04.79) B01f-17 C11d-03/60

Aq. surfactant compsn. contains 2 to 30 wt.% surfactant or
mixed surfactants, selected from anionic, cationic, non-
ionic, and amphoteric surfactants, ≥0.05 wt.% of a poly-
mer of 20,000 to 1000,000 average mol. wt. of formula (I)



$$\left(-CH_2-\overset{\overset{R_1}{|}}{\underset{\underset{COOR_2}{|}}{C}}-\right)_m\left(-CH_2-\overset{\overset{R_3}{|}}{\underset{\underset{COOR_4N^+(R_5)_2R_6COO^-}{|}}{C}}-\right)_n \quad (I)$$

(where R_2 and R_3 are H or CH_3, R_2 is 1 to 18C alkyl, R_4 and R_6 are 1 to 4C alkylene, R_5 is H, CH_3, or C_2H_5, and m/n are in the mole ratio 1/9 to 8/2), and 0.01 to 10 wt.% of a fine granular solid substance, e.g. fungicide, pigment, emulsifier, pearl brightener, etc.

The compsn. provides very stable solid dispersion systems even in the presence of strong electrolytes, i.e. no floatation, precipitation, coagulation, segregation, etc. of solid particles. The compsn. is useful in a multipurpose cleaner, and other dispersion systems. 12.9.77 as 109577 (7pp117)

MEIK- ★ D25 37803B/20 ★J5 4043-904

Surfactant-impregnated paper used e.g. as a soap - is prepd. by immersing water-soluble paper in a soln. comprising surfactant and methanol, and drying the paper

MEIKO KK 14.09.77-JA-110857

(06.04.79) C11d-13

The paper soap is produced by coating a soln. comprising 20-50 wt.% of a surfactant, e.g. alkylallylsulphonate and alkylbenzenesulphonate, etc. and 80-50 wt.% of MeOH on a water-soluble paper, followed by drying with hot air or in an oven. The coating of the soln. is pref. carried-out by a roller coater.

Dissolution or damage of the water-soluble paper due to immersing it in the surfactant soln., does not occur because the water-soluble paper is coated with the MeOH soln. of the surfactant, contng. no water. The MeOH soln is prepd. of comparative low concn. having excellent permeability and fluidity, even the surfactant is in paste-like or in solid state, thereby it is not generated any difference in the concn. distribution of the detergent between the surface and the inside of the water-soluble paper. 14.9.77 as 110857 (2pp34)

MITK ★ D25 38128B/20 ★J5 4045-698

Easily dispersible alumina hydrate mfr. - by hydrolysis of an alkyl aluminium cpd. by contact with steam in gas phase

MITSUI TOATSU CHEM INC 17.09.77-JA-111240

A60 E33 G01 (11.04.79) C01f-07/36

Mfr. of alumina hydrate by hydrolysing alkyl Al cpd., comprises contacting vapour of alkyl Al cpd. with steam in gas phase at 100-500°C. The alumina hydrate has an excellent dispersability and its mean particle size is 100 A. This alumina hydrate may be used for material of alumina sol, filler for plastics, extender for various detergents.

In an example, to raw material tank 100 g. of triethyl aluminium was placed and N_2 was passed at the rate of 1.6 l/min. through introduction pipe and the raw material tank was heated to 130°C. Alternatively, to water tank 200 g. of distilled water was placed and heated to 60°C. Nitrogen gas is passed at the rate of 6 l/min. through introduction pipe. Vapour of triethyl aluminium from raw material tank and steam from water tank were contacted at the reactor and hydrolysed, and thus alumina hydrate was formed. 17.9.77 as 111240 (6pp96)

Weekly by section in BAJ only. Entries under any given patentee code heading are in earliest priority date order. The title, truncated to 105 characters, is followed by the accession number and current patent number. The last line of each entry consists of the patentee name, the priority details (earliest then latest if there is more than one) and finally the Derwent classes. This index is cumulated quarterly and annually by section as hard copy. Overall A—M cumulations of from a quarter up to 5 years are available as COM.

In Basic Abstracts Journal only

MANUAL CODE INDEX IN Basic Abstracts Journal only

At the start of each main group of codes, the manual code and its descriptor are printed in the middle of the column. Each sub-division of a manual code group appearing during the week is given, accompanied by its descriptor. All manual codes occurring during the week within each sub-division are then listed, with accession numbers posted against them.

In all there are about 3,600 manual codes in CPI, each one having an average of less than 200 documents assigned to it per year. The full classification is set out in the Manual Code Instruction Manual, which also contains a keyword index of terms for easy reference.

APPENDIX 1

COUNTRY COVERAGE

"Major" Countries

Covered completely in CPI and WPI from the commencement of the service except: Research Disclosure 1978, Europe and PCT 1979, Sweden transferred from "Minor Countries" 1979. Average weekly numbers are listed alongside.

Fast publishing

Belgium	180	
Europe	150	
France	740	
Germany, W. unexamined	1050	
Japan unexamined	845*	
Netherlands unexamined	240	
PCT	40	
Research Disclosure	20	
South Africa	100	
Sweden	260	
United Kingdom unexamined	600	3325

Slow publishing

Canada	450	
Germany, E.	100	
Germany, W. examined	465	
Japan examined	340*	
Netherlands examined	60	
Soviet Union	1200	
Switzerland	260	
United Kingdom examined	300	
United States	1200	4375

*Only CPI coverage for Japan.

"Minor" Countries

Complete coverage, but only introduced during 1975, with exception of Italy 1978.

Fast publishing

Brazil	140	
Denmark	120	
Finland	60	
Norway	80	
Portugal	30	430

Slow publishing

Austria	125	
Czechoslvakia	180	
Hungary	35	
Israel	40	
Italy	155	
Rumania	25	560

MINOR AND MAJOR COUNTRIES

If the first publication of an invention takes place in one of the 'major' countries listed above, then this publication is called the basic patent, a WPI accession number is assigned, and this is used for all subsequent members of the family.

If, however, the first publication occurs in one of the 'minor' countries listed above, then the document is regarded as a provisional basic. No accession number is assigned, since an abstract is not provided. If this provisional basic is then followed by further family members also from 'minor' countries, these produce entries in the same indexes even though an accession number has still not been assigned.

However, as soon as a member of the family is published in one of the 'major' countries, then this is regarded as the first disclosure. An accession number is assigned, and will apply also to all the earlier members of the family (from the 'minor' countries). Hence it is possible to see, in Index V, entries where the basic has a later week number than some of its equivalents.

For CPI, if the first publication occurs in Sweden, South Africa or Japan — in the case of Non-Japanese nationals — then the document is treated as a provisional basic as outlined above. Other than for Japan where a heading is given, an Alerting abstract is included in CPI at this stage.

Subsequently, when a documentation abstract is available an accession number is assigned to the document and the abstract published in the BAJ and related products. Headings will be included in the Alerting Bulletins for Sweden and South Africa together with abstracts for the Japanese at this later stage.

Entries are included in WPI Gazettes at both stages. At the later stage both a basic and an equivalent heading will be given for each such patent number.

COUNTRY CODES

For patent number (not priority) purposes, DS disting accepted West German specifications (DAS) fror unexamined applications (OLS) which are given the n DT code. in the case of Japan J5 represents unexamined applications, and J7 the examined o present series.

Arrangement of Abstracts

See Appendix I for definition of 'Major' and 'Minor' Countries.

'MAJOR' COUNTRIES – An alerting abstract of every basic and examined equivalent document is provided except for equivalents from Canada, East Germany and Switzerland. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

See inside cover for further details.

D11 : BAKING

/ ★ D11 B/21 ★BR 7706-162
ading machine for bread making - including spiral fork for gh movement activated by two pulleys and two gears
SEJTMAN J 14.09.77-BR-006162
(10.04.79) A21c-01/02

T/ ★ D11 B/21 ★BR 7706-163
ading machine for bread making - has pulley complex driving ft to move large basin where dough is handled
SEJTMAN J 14.09.77-BR-006163
(10.04.79) A21c-01/02

BH/ ★ D11 39106B/21 ★DL -134-722
cessing enzyme-rich baking flour - by adding polyvalent ion salt d/or aminated or amino-carboxylic acid or deriv.
GEBHARDT E 20.01.78-DL-203326
(21.03.79) A21d-02/02

zyme-rich flour is processed for baking by adding (a) polyvalent ion salt quantity causing the same effect as increase in NaCl content, or (b) an aminated carboxy- - or 2-amino-carboxylic acid or deriv. quantity creasing the max. amylogram magnitude 1.2-2 x, or) a mixt. of polyvalent ion salt and aminated- or amino- rboxylic acid or deriv. quantity, such as to cause same fect as NaCl content increase while also increasing max. nylogram magnitude 1.2-2x.

Germination-damaged cereal flour can be processed r baking without reducing taste by salting or souring inhibit enzyme activity. 20. 1. 78 as 203326 (5pp200)

AS/ ★ D11 39272B/21 ★DT 2751-078
ual container for pasty foodstuff e.g. mustard mayonnaise - omprises two plastics, communicating bags mounted on a plastics, reakable base
BLASY L 15.11.77-DT-751078
A92 Q34 (17.05.79) B65d-85/70

omposite container assembly for flowable, especially asty materials e.g. mustard, mayonnaise, or finely ivided solids, comprises 2 containers such as bags, achets or pouches, with deformable walls, which communicate by means of a flexible connecting duct.

Containers and connecting duct are arranged upon a igid base plate designed to fracture near the connecting uct. The base plate doubles as the underside of the duct. he walls of containers and duct are made of plastics ilm e.g. polyethylene or polypropylene. The base plate s made of polystyrene. 15.11.77 as 751078 (11pp267).

OHN/ ★ D11 39292B/21 ★DT 2751-263
aking plate set for crisp pastry - has bosses on surface and notches n sides for steam escape control
HOHN K 14.11.77-DT-751263
(17.05.79) A21b-03/13

A set of baking plates for pastry such as waffles and crackers consists of an upper and a lower plate each with two sides. The baking surfaces have raised bosses in an irregular pattern. The sides have many tapering notches, starting at their upper edges.

The bosses prevent too fast an escape of the water vapour. The side notches allow the steam to be released. The result is a more uniformly baked pastry of crisp consistency. 14.11.77 as 751263 (11pp39).

ZANE/ ★ D11 B/21 ★IT 1029-028
Capillary drying of food pastes - by successive evaporation and cooling to eliminate most of the moisture
ZANETTI P 13.01.75-IT-041507
(10.03.79) A21c

HETO ★ D11 40055B/21 ★SU -615-913
Well-shaped macaroni products from wheat - are prepd. by adding sodium alginate, calcium gluconate or lactate and potash
HETEROORG CPDS AS USSR 23.09.76-SU-407852
(19.06.78) A23l-01/16

Macaroni products are made from flour with various binding additives. Products of improved quality are made from flour and the following additives (wt.%): Na alginate 0.3-2.5, Ca gluconate or lactate 0.2-1.2, potash 0.2-0.8, and the remainder is flour.

Chimirov, Yu.I., Braudo, E.E., Tolstoguzov, V.B.

MEIP ★ D11 40372B/21 ★US 4152-976
Applying topping material, e.g. cheese to pizza - by grating cheese and discharging weighed portion via chute with movable shroud
MEIJI NYUGYO KK 02.07.76-JA-U87612
(08.05.79) A21c-09/04

Appts. for applying e.g. cheese topping to pizza crusts is mounted above a conveyor which carries the crusts beneath a station which includes a stop plate which temporarily halts a crust. A guide tube is then lowered to surround the crust and a predetermined weight of grated cheese is discharged onto the crust via a rotating blade to distribute the topping evenly. The topped crust is then released. The charge of topping is prepd. by grating cheese and feeding it into a weighing cell via a conveyor which halts when the predetermined weight has accumulated in the cell.

The guide tube ensures that all the topping is applied to the pizza. 26.6.77 as 811443 (9pp 295)

D12 : MEAT ; FISH PROCESSING

SEBS- ★ D12 39020B/21 ★BE -873-547
Domestic wax melting installation - for depilation of hides etc., uses cheap throwaway filter to obviate cleaning
SEB SA 21.02.78-FR-004897
A96 (16.05.79) A22c B01d

A heated tank is used to melt both fresh and recycled wax. The molten wax is delivered via a filter which removes hairs from the wax. The filter now comprises a removable filter element made of lightweight flexible material which is permeable to hot molten wax. The material can ithstand a temp. of at least 120°C. Once removed, the element is disposable and replaced by a new one

The filter material is pref. composed of unwoven synthetic fibres, partic. polyester fibres thermally bonded together. Alternatively, the material can be a woven fabric In either case, the element pref. takes the form of a box which is collapsible for transport and storage. When erected, the box element pref. fits inside the melting tank as a liner.

Used in filtering hairs from recycled wax in a depilation installation, esp. a small scale installation for domestic use. Throw-away, inexpensive filter element obviates diff-

ult cleaning operation involved in re-using elements.
.1.79 as 873547 (12pp448)

HR- ★ D12 39045B/21 ★DL-134-476
at product filler spout - with curved outer surface of inner tube
ming annular chamber and slot
VEB NAHRUNGSGUTERMA 28.12.77-DL-202987
Q31 (07.03.79) A22c-11/02 B65b-39

filler spout for the extrusion of reconstituted meat
oducts with an addition of synthetic albumin fibres or of
usage meat with a skin of synthetic albumin consists
an inner tube with a curved outer surface which can
closed. The outer tube has several tangential inlets
o a chamber which is formed by the S-shaped contours
the inner tube, terminating in a narrower annular slot
wards the conical mouthpiece.

This results in a good alignment of the fibre filling.
e spout is easy to clean and is usable for a wide variety
food products. 28.12.77 as 202987 (8pp39)

S/ ★ D12 39145B/21 ★DL-134-837
d paste filling machine - with mincer and compactor filling
rnate cylinders without air access
DEISENROTH R 07.03.78-DL-204004
(28.03.79) A22c-11

filling device for food pastes, such as minced meat
ods, consists of a chopping device which discharges
rectly in a compressing station. Two filler cylinders are
ovided, one of which is filled as the other is emptied
a piston into a sausage skin or tin.

This eliminates the risk of injuries and prevents the
cess of air to the food. Losses of food prods. by spill-
e are cut out. 7.3.78 as 204004 (7pp39)

YN/ D12 34990A/20 =DS 2756-347
ractor for cloaca of poultry - has accurately aligned, knife-
ntering pin preventing damage to carcass or entrails
MEYN P 24.01.77-NL-000677 (12.01.77-NL-000233)
*(17.05.79) *BE-862-059 A22c-21/06*

machine to cut out the cloaca from poultry is fitted with
lade in the form of a hollow cylinder with a sharpened
d rim. The blade is supported on a hollow shaft which
s at the end a centring pin. This pin can be introduced
o the anus of a chicken which travels suspended from an
erhead rail. The cylindrical blade is fitted with a spiral
ot in which a radial pin of the hollow shaft slides. This
sures that on impact the blade is advanced at a high
eed centrally to the pin and cuts out the cloaca.

This is a simple device which requires neither vacuum
r compressed air. 17.12.77 as 756347(12pp39)

E= ★ D12 40051B/21 ★SU-615-909
at-feeder for processing machine - has base plate at head of
chine, which is hinged, to enable body to rotate oppositely to
d screw
LENGD MEAT IND ASSO 28.06.76-SU-387229
(16.06.78) A22c-17

at-feeder for a machine in which the meat is processed
nprises a body contg. a screw, a drive and trans-
ssion unit. Raw materials of different consistencies
fed in uniformly by providing a base, fastened to the
d of the machine by means of a hinged attachment.
e screw is mounted rigidly on this base, with the body
o mounted on the base so that it can rotate in a direction opposite to that in which the screw turns. The hinged attachment consists of a brake, a toothed clutch, with the rotational axis passing through the base and the head of the machine.

Lempert, E.N., Bul. 27/25.7.78. 28.6.76. as 387229 (4pp29)

UMEA= ★ D12 40052B/21 ★SU-615-910
Two/stage electrical contact cooking of hams - with direct contact between thick end and electrodes in first stage for more uniform heating
UKR MEAT DAIRY IND 02.08.76-SU-389354
(16.06.78) A23b-04

A.C is passed through hams immersed in electrolyte soln. in a dielectric bath. For more uniform heating and improvement in quality cooking is carried out in two stages, the first with 100-1000 A/m² current when the electrodes contact the thick part of the hams.

After the internal temp. reaches 35-40°C, second stage heating is carried out with 400-500 A/m² current passed through the electrolyte until the internal temp. reaches 70-72°C.

The total process time for a 7-8 kg. ham is 50 min. using 0.5% NaCl soln. with an initial temp. of 37°C and a current density of 1000 A/m². Process time and power consumption are reduced by 20-30%.

Bunke, E.K., Galushchenko, V.A., Rubanik, V.V. Bul. 27/25.7.78. 2.8.76. as 389354 (2pp1358)

UMEA= ★ D12 40053B/21 ★SU-615-911
Electro-cooking hams in electrolyte bath - by reducing level after upper narrow end has reached cooking temp. for more uniform heating
UKR MEAT DAIRY IND 12.07.76-SU-390189
(16.06.78) A23b-04/02

Hams are placed in a dielectric tank contg. electrolyte soln. between electrodes and an a.c. is passed. To ensure uniform heating and improved quality, after a temp. of 70-72°C has been reached in the upper narrower end of the hams, the electrolyte level is reduced to the wider part. Treatment is carried out at 200-400 V/m and 300-600 A/m².

In an example, for a ham weighing 7-8 kg. the upper end temp. reaches 72°C after 20 min. in 0.5% NaCl soln. on treatment with 400 V/m and 600 A/m² a.c. After reducing the level, the heating is continued until the ham centre temp. reaches 72°C, the whole process requiring 45 min.

Bunke, E.K., Galushchenko, V.A., Rubanik, V.V. Bul. 27/25.7.78. 12.7.76. as 390189 (2pp1358)

KUPO= ★ D12 40188B/21 ★SU-616-190
Bags for filling with sausage meat product - formed by longitudinal welding of heat sealable strip, filling with product and pinch-sealing to form bag
KAUN POLY 23.06.76-SU-378120
A35 Q31 (A92) (11.07.78) A22c-11 B65b-09

Device for making, filling, and sealing packets made from heat-sealable strip material (for packing viscous and plastic materials in the food, meat-dairy, chemical, etc. industries) comprises a bag-former, tube with elastic conical tip at the lower end, and mechanism for longitudinally welding the plastic tube and sealing the ends of the packets. The packing is hermetic and pulsation of pressure in the product feeding line is compensated for by fitting the elastic conical tip with a corrugated collar. The strip of thermoplastic material is fed from a roll to the bag-former and the tubular bag made and continuous drawn over rollers so that it can be welded longitudinally The products being packed are sausages, and the package is treated so that individual objects are kept separate.

Paulauskas, L.A., Sipavichyus, A.Yu., Rinkyavichyus, V.M. et al. Bul. 27/25.7.78. 23.6.76. as 378120 (2pp29)

D13 : OTHER FOODSTUFFS

T/ ★ D13 39012B/21 ★BE -873-516

nk prepd. by water extn. of wood bark and sap - without washing sel between extractions

HERTTUA K 20.01.78-SF-000180

(16.05.79) A23f A23p

e extn. of bark, sap and albumum of wood, partic. of ng bark and sap of pines and junipers is carried out ng boilding water and decanting and filtering the extract d. One or several pre-charges of material are extrac- in an extn. reservoir, followed by removal of the pre- racts and extn. residues without removing the protec- e layer on the inner surface of the extn. reservoir. e procedure is repeated until a distinct red colour react on is seen in the extract, after which in later extns., the tn. is stopped when the red colour is seen and this tract is recovered.

The retention of the layer enables the colour formation ich provides an indicator which ensures uniform prod. ality. 16. 1. 79 as 873516 (6pp597)

ND- ★ D13 39046B/21 ★DL -134-477

dder prodn. from animal excrement - i.e. dung or liquid manure subjecting to acidic hydrolysis and neutralising the hydrolysate

AKAD LANDWIRTSCHAFT 19.01.78-DL-203311

C03 (07.03.79) A23k-01

a new process for prodn. of fodder from animal excre- ent and liquid manure from cattle and/or pig rearing, ng (previously sepd. from urine and additional water) liquid manure is hydrolysed for 4-6 hrs. at ca 100°C ith an inorganic acid (pref. HCl in an amount of ca 1. per 100kg dry substance).

If thehydrolysate is intended for direct use as fodder, is neutralised to pH 3-4, pref. with $CaCO_3$. Hydrolysed ng intended for yeast fermentation is neutralised with e urine-water mixt. from the prim. sepn. step preceding e hydrolysis. Hydrolysed liquid manure intended for east fermentation is neutralised to pH ca 4. 5 with other asic substances. 19. 1. 78 as 203311 (8pp280)

ULS/ ★ D13 39071B/21 ★DL -134-597

creasing dry solids content of milk products - e.g. curds or cheese, heat treatment immediately before sepn. process

HULSEN U 16.12.77-DL-202681

(14.03.79) A23c-19/02

n a method for varying the dry substance content of pro- ein-contg. products (esp. curds and special types of resh cheese produced by a separatory process) produced rom thickened milk by adding pure cultures and rennet erments to the kettle milk, the thickened milk immediate -ly before the sepn process is subjected to a further heat reatment. The temp. being so chosen that a structural state is imparted to the thickened milk which (a) improves ts susceptibility to separation by altering the viscosity and (b) does not lead to flocculation or the formation of granular or sandy casein particles.

The additional temperature treatment makes the separa- tion process universally applicable to the prodn. of pro- tein-contg. products from milk. The additional heat reatment is pref. effected at 35-50°C, esp. 45-50°C. 16. 12. 77 as 202681 (9pp280)

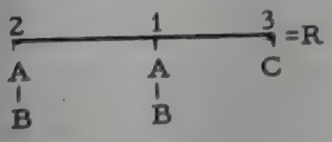
EAK ★ D13 39156B/21 ★DL -134-874

Biomass sepn. from hydrocarbon-contg. nutrient soln. - using a mixture of lignin sulphonic acid and poly:ol as surfactant

AKAD WISSENSCHAFT DDR 08.03.78-DL-204024

C03 (28.03.79) C12d-13/06

In the prodn. of purified biomass by cultivation of liquid hydrocarbons, and separation and subsequent purification of the biomass with non-polar hydrocarbons in the pres- ence of surface active substances, there is used as the surfactant compsn. a mixture of (A) lignisulphonic acid and (B) a cpd. of formula (I)



$$\begin{array}{ccccc} 2 & & 1 & & 3 \\ \vdash & - & + & - & \dashv \\ A & & A & & C \\ | & & | & & \\ B & & B & & \end{array} = R \quad (I)$$

In (I) R=aliphatic hydrocarbon with 8-20C chain, A=-CO-, $-SO_2-$, $-SO_3-$, -NH-, -O-, $-CH_2-CH_2-O-$, -CO-NH-N=CH-, $(-CH_2-)_x$ (x=1-8), -CO-NH-, or -NH-CO-NH, B=hydroxy cpd. with 3 OH groups, pref. a carbohydrate, C= charged groups, e.g. $-SO_3^-$, $-SO_4^-$, $-HPO_4^-$ or $-COO^-$, 1, 2, 3=position of the substituent groups on the hydrocarbon R, as characterised by the following R-A-B A and B in position 1 or 2, $R\genfrac{}{}{0pt}{}{A-B}{A-B}$ A and B in the 1, 2- or 2, 3-position, $R\genfrac{}{}{0pt}{}{B}{C}$ B and C in the 1, 2- or 2, 3-position, $R\genfrac{}{}{0pt}{}{C}{A-B}$ or $C-R\genfrac{}{}{0pt}{}{A-B}{A-B}$ A, B and C in the 1, 2- or 2, 3-position, or A, B in the 1, 2- or 2, 3-position and C in the 1- or 3-position.

Use of a combination of (I) and ligninsulphonic aicd enables hydrocarbons to be sepd. from the biomass with- out formation of an emulsion. 8. 3. 78 as 204024 (12pp280)

Automatically controlling caramel degree of liquid - by measuring light reflected from liquid surface by two different wavelength radiations (NL 23.1.78

MORINAGA & CO LTD 19.07.76-JA-085790

*+P28 (17.05.79) *DT2732-609 A23g-03/32*

In a process for the automatic supervision and control of the degree of caramelization of a fluid in the mfr. of sweets, the boiled fluid is transferred from a boiler to a caramelization vessel with a stirrer. The caramelization detector is installed in the following cooling tank; its signals are used to control the speed of a paddle mixer in- side the caramelization vessel.

This automatically supervises and controls the plant and can be used to discharge fluid at a constant level. 19. 7. 77 as 732609(8pp39)

Immunisation of poultry to coccidiosis - by mixing spore carrying oocysts with the feedstuff (NL 16.5.79)
UNILEVER NV 14.11.77-GB-047335
A96 B04 C03 (17.05.79) A23k-01/18 A61k-39

A method to promote growth in poultry comprises raising the poultry on a normal diet in which the food contains spore-carrying oocysts of a coccide species to which the poultry is sensitive.

Coccidiosis in poultry can be controlled. Poultry which have suffered once from coccidiosis are immune to further infection, thus the process immunises the poultry to coccidiosis. The immunising process can begin with chickens as soon as they are able to eat solid foods. 13.11.78 as 849226 (26pp1401).

Milk powder distributor for baby food - forming compacted plug for addn. of water and including counting device
LYALL R 16.08.77-GB-034363
R13 (20.04.79) A23c-09/16 G01f-11

Distribution process is intended for a measured quantity of a powdered milk prod. for babies; the appts. comprises a cylindrical measuring cylinder fitted with a movable piston.

The piston slides in the cylindrical compartment and the plunger moves in the measuring chamber. For use, the extension is forced into the mass of powder until the collar makes contact with the surface of the powder; this ensures that the sleeve is forced into the mass to a depth of twice the measuring chamber and ensures max. compaction of the plug of powder in the latter. The distributor is withdrawn with the plug of powder which is then ejected into a recipient by pressure on the operating piston against the pressure of the spring.

As the amt. of powder required varies with the age of the baby, different multiples of the predetermined dose can be used and their number is recorded on the counter wheel; the numbers 1 to 9 can be seen through the window.

The distributor can deliver an accurately measured quantity of powdered milk prod. to suit babies of different ages and record the amt. delivered on a dial. 11.8.78 as 023814 (15pp519).

Hydraulically powered rotating feed auger for hopper - e.g. fo grain with twin cylinders and rotary hydraulic valve
NEIER B R 21.09.77-US-835316
(08.05.79) A23n-17 B01f-07/08

An auger for feed is rotated by a crank connected to a pai of double acting hydraulic cylinders. A rotating valve is synchronised with the auger and connects high and low pressure supplies tothe cylinders alternately to provides rotation of the crank.

The valve comprises a rotor with a V barrier connecte to the high pressure supply while the remainder of the rot- or is connected to the low pressure. The V subtends an angle of 90-180° and the ports of the cylinders are staggered at 90° intervals round the valve body. Longitudinal bores in the rotor connect it with the high and low pressure conduits.

The auger is used to churn up feed materials in a hopper. It may be used with drain, food supplements, silage or molasses. The hydraulic cylinders operate directly on the crank of the auger and eliminate the need for intermediate chains or drives. 21.9.77 as 835316 (8pp295)

Electrolytic removal of cyanide from continuously flowing or static water systems comprises addn. of a soluble Cu^{2+} salt, (50 - 150, esp. 100 mg Cu^{2+}/dm^3), followed by electrolysis with stainless steel anode, e.g. using 2.3V and 100A for 6-7 hr. 20.10.72 as 251442(2pp47)

PASE D15 36075W/22 =DS 2356-082
Bar screen collected material dewatered - by pressure or friction on rake and during passage to disposal conveyor
PASSAVANTW MICHELBACHER 09.11.73-DT-356082
*(17.05.79) *DT2356-082 C02c-01/22*

Material collected from a bar screen by means of a scoop, is lifted clear of the screen and a press force is applied to it, for example by a hinged plate. This presses the material against a springloaded counter plate so that the material is dewatered thereby and moved off the scoop. When the scoop moves away for the next cycle, the counter plate moves the material over a chute to a conveyor.

This combines the dewatering with the clearing operation and is independent of size or output of the plant. 9.11.73 as 356082(9pp39)

adioactively contaminated sewage treated by concn. and decay - two tanks operated alternately in optimised cycle

FRIESEKE & HOEPFNER GMBH 11.11.77-DT-750429

K07 (17.05.79) G21f-09/04

. method of treating radioactive liquid effluent, esp. from ospital toilet facilities where isotopes have been used, s as follows. The liquid effluent is stored at raised temp. n a tank and air is bubbled through the tank to become ighly saturated with water; this air is then condensed, the ondensate is monitored with a radiation detector and discharged to the drainage system, and the residual air is assed through a filter or washing unit, then also monitored with a radiation detector and discharged to atmosphere.

When this process has continued sufficiently for a specific radiation level in the tank to be reached the process s switched over to a second tank and repeated there. The volumes of the two tanks are so designed that the enrichment time to a specific activity level in the tank through which the air is being blown is equal to the decay time in the other, enriched tank required for the activity level to come down to an acceptable value. More specifically, the air remaining after condensate has been extracted does not pass through a filter or washing unit but is used as blowing air for the process.

By comparison with a simple decay plant, a reduction of almost 50% in capital cost is achieved. 11.11.77 as 750429 (9pp237).

HRUS/ ★ D15 39220B/21 ★DT 2750-626

Lime admixture to sewage - with radial water jets in downstream mixing pipe length

HRUSCHKA H 11.11.77-DT-750626

(17.05.79) C02c-01/18

Lime is added in the form of powder to sewage in an open channel at a point which is followed by a mixing stretch. The mixing stretch includes an enclosed pipe below the lowest possible water levelin the channel. Nozzles which are arranged in the pipe are connected to a pump for the injection of additional water from a reclarification basin.

This ensures that the lime is suspended in the sewage in extremely fine distribution and is fully dissolved. No moving parts are exposed to the abrasive action of a lime suspension and the power costs for paddle mixers have been saved. 11.11.77 as 750626 (11pp39).

Water softening system for dishwashers - has pilot operated spool valve between salt and ion exchanger containers

BOSCH-SIEMENS HAUS 12.11.77-DT-750658

P28 (17.05.79) A47l-15/42 C02b-01/40

A water softening system for domestic appliances such as dish washers has a pilot-operated spool valve between the salt container and the ion exchanger container. The water pressure in one fresh water pipe acting on one face of the spool urges the valve into the OFF position, and that in the second pipe moves it into the ON position where it permits brine to pass to the ion exchanger for regeneration.

This is a simple and functionally reliable method to initiate the ion exchanger regeneration. This valve has a low flow resistance in its ON position. 12.11.77 as 750658 (11pp39).

PASS- ★ D15 39231B/21 ★DT 2750-736

Multistage desalination plant - with each column divided into evaporation and condensation space with impact extractor between

PASS & CO 12.11.77-DT-750736

J01 (17.05.79) B01d-03/06 C02b-01/06

A multistage desalination plant consists of several identical columns, each consisting of a vertical pressure vessel which is divided by a horizontal partition in an upper condensation space and a lower evaporation space. The upper space is horizontally extended by an intersecting cylindrical container for the condenser tube coil. The partition has a cutout, surmounted by an impact extractor e.g. with a metal wool packing.

This plant has a simple design and requires very little floor space. The columns of each stage are not expensive to mfr.. 12.11.77 as 750736 (17pp39).

PASS- ★ D15 39235B/21 ★DT 2750-764

Evaporative desalination plant - with condensers arranged crosswise under series connected evaporators

PASS & CO 12.11.77-DT-750764

J01 (17.05.79) B01d-03/06 C02b-01/06

An evaporative desalination plant has the evaporator spaces of all columns arranged axially in one horizontal tank, with partitions having passages at the lowest point and baffle plates between the partitions. The condensators are arranged crosswise under each evaporator and are joined to them by offtake pipes with a short vertical upward and a long descending pipe section.

This simplifies the design for each column and saves floor space. The distillation throughput can be readily adjusted to varying requirements. 12.11.77 as 750764 (22pp39).

PASS- ★ D15 39236B/21 ★DT 2750-765

Evaporative desalination plant - with condensation space in each column above evaporation space in same tank

PASS & CO 12.11.77-DT-750765

J01 (17.05.79) B01d-03/06 C02b-01/06

An evaporative desalination plant consists of several identical columns, each column consisting of a vertical cylindrical pressure vessel. The condensation space of each lies directly above the evaporation space and communicated with it through a vertical tube which protrudes a certain height into the condensation space.

This has twice the distillation capacity for the same floor space, compared with a conventional plant. Each column is of simple design and easy to mfr.. Each column can be assembled and tested completely in the works. 12.11.77 as 750765 (18pp39).

REIC- ★ D15 39243B/21 ★DT 2750-789

Portable drinking water preparation package - with coarse and fine purification and desalination sections

REICHLING R & CO 14.11.77-DT-750789

(17.05.79) C02b-01

A portable drinking water preparation plant is enclosed in a standard container. It consists of a coarse and a fine purification section and a desalination section. It has a crude water inlet and outlets for the drinking water and for the pulp.

This plant is easily transported by lorries or helicopter to the required site in emergencies. It can purify surface waters or sea water to the standards required by the World Health Authority for drinking water. 14.11.77 as 750789 (20pp39).

Membrane mfr. for ultrfiltration, reversed osmosis, etc. - by embedding parallel micro:filaments in membrane material and removing by solvents

STEMME R 14.11.77-DT-750897

A88 F04 J01 (17.05.79) B01d-13/04

Organic or inorganic microfilaments having to a great extent the same diameter, are embedded in material for the formation of membrane bodies for ultrafiltration and reversed osmosis. After the formation, the microfilaments are dissolved out, leaving behind open, pore channels with smooth walls. Before or during the embedding process, the microfilaments are aligned largely parallel to each other. The preferred alignment is imparted to the microfilaments during growth by external forces such as electrical or magnetic fields, or gravitational or inertial forces.

Process provides a membrane with a wide range of applications from ultrafiltration to desalination, having uniform pores at high density in resistant membrane material, at costs of production which, taking into consideration the technical advantages, makes possible an expansion of its applications, together with improved performance in present uses. 14.11.77 as 750897 (9pp1045).

POLY- ★ D15 39310B/21 ★DT 2846-483

Agitator for biological toilet - comprises a metal rod folded to give vanes and journals

Rotary biological filter - with horizontal Archimedean spiral designed as scoop wheel

ASKO-UPO OY (AGAA) 16.11.77-SF-003467

J01 (17.05.79) B01d-33/02 C02c-01/04

A biological filter includes a drum which rotates around a horizontal axle. The walls of the drum are designed as an Archimedean spiral which picks up a certain amount of the liquid to pass through its filling of a nutrient medium for bacteria. At the wheel hub, the water runs off purified into a tray for discharge or recycling.

This ensures a filter path long enough to give a satisfactory purification. It takes up less space than biological filter towers. 11.11.78 as 849013 (9pp39).

CARB- ★ D15 39394B/21 ★FR 2400-489

Biological purification of waste water - includes oxygenation, degradation, nitrification and denitrification steps

CARBOXYQUE FRANCAIS 17.08.77-FR-025148

(20.04.79) C02c-05/10

Waste water is treated continuously by first decanting off from sludge, then charging it with oxygen. The liq. with oxygen dissolved in it is then aerobically treated to cause degradation of the substances in it, further aerobically treated to convert nitrogenous material into nitrates, and then, after de-gassing, treated anaerobically to decompose the nitrates, free nitrogen being liberated.

The flow is regulated by analysis of the purified water, partic. w.r.t. its chemical oxygen demand. The process can be conducted under press. The biological degradation and other treatments are conducted using specific bacteria for the various stages. The bacteria used can also be adapted to other components of the treated water, e.g. S and sulphites.

The process overcomes lack of response to variations in flow rate, incapability of treating feebly charged effluents, and lack of elimination of nitrogenous cpds., these difficulties being caused by the low oxygen transfer capacity of previous systems. Installations used to effect this process are very flexible in operation. 17.8.77 as 025148 (9pp1331).

Concentrating sewage sludge - using a mineral oil emulsion of cationic emulsifier

EBARA INFILCO KK 20.09.77-JA-112934

(13.04.79) C02c-03

Sewage sludge mixed with air-dissolved water is treated with a mineral oil emulsion comprising a cationic emulsifier consisting of ⩾1 of >8C long chain alkyl-contg. aliphatic mono-, di- or polyamines and rosin derivs. in an amt. of 0.1-20 wt.% of mineral oil, and a mineral oil of b.pt. >150°C, having no volatile components. Treatment is performed with violent agitation, and then sepn. of floating sludge is performed under reduced pressure while generating fine gas bubbles.

The method is capable of obtaining a highly concn. frothy sludge and of economically performing filtration, dehydration, drying, etc. with high efficiency and more econon cally. The sludge is e.g. fresh mixed sludge, excess activated sludge, etc. 20.9.77 as 112934 (4pp117)

TOAG ★ D15 39686B/21 ★J5 4047-357

Treating waste water contg. oxidisable substances - by subjecting to oxidn. treatment with hydrogen peroxide in presence of iron salt catalyst

TOA GOSEI CHEM IND LTD 22.09.77-JA-113207

(13.04.79) C02c-05/04

In the treatment of waste water contg. oxidisable substances, e.g. inorganic compounds, carbohydrates, alcohols, aldehydes, carboxylic acids, nitriles, esters, ethers, organic salts, amino acids, water-soluble polymers, surfactants, oils, fats, etc. the waste water is subjected to oxidation treatment with H_2O_2 in the presence of an Fe salt catalyst.

The desired amts. of H_2O_2 and/or Fe salt catalyst are added in a sepg. addn. method in which one or both of the H_2O_2 and Fe salt catalyst are consecutively added with the elapse of time, or are added at different positions at pH 7.0, and then after the oxidation reaction has terminated, the pH is regulated by the addition of an alkali to ppte. soluble Fe compounds which is in turn sepd. for recycling as Fe salt catalyst.

Method increases the oxidn. efficiency of the waste wate treatment system to a great extent as compared with the method in which H_2O_2 and Fe salt catalyst are added simultaneously. 22.9.77 as 113207 (7pp117)

TOAG ★ D15 39687B/21 ★J5 4047-358

Human waste treatment - by oxidising secondary water from aerobic treatment with hydrogen peroxide in presence of iron salt catalyst which is recovered

TOA GOSEI CHEM IND LTD 22.09.77-JA-113208

(13.04.79) C02c-01/40

In the treatment of human waste in which the primary treated water is first diluted and then subjected to aerobic biological treatment, or secondary treatment, the secondary treated water is oxidised with H_2O_2 in the presence of an iron salt catalyst in an amt. of 1 to 500 mg/l (as Fe) at a pH of 1.5-7 and at 0-70°C for 0.1-100 hours. The pH of the treated water from the oxidation is adjusted to 5-9 by the addition of an alkali to ppte. soluble iron salts which are sepd. by means of a coagulating sedimentation method etc. for recycling as iron salt catalyst, while the treating water so sepd. is also recucled as a diluting water for the secondary treatment.

The method in which the treated water is recycled as diluting water for the secondary treatment at a recycling rate of 10-100%, greatly contributes to the saving of fresh water used and also reduces the amt. of treated water released to the outside which causes water pollution. 22.9.77 as 113208 (5pp117)

Oil-contg. waste water treatment - using a purifying column comprising crosslinked polymer e.g. polyethylene, and inorganic species, e.g. magnesium oxide
MITSUBISHI RAYON KK 22.09.77-JA-114183
A97 (13.04.79) C02c-05/02

Waste water is forcibly passed through a treating column packed with a treating compound, obtained by the procedure in which 100 wt. pts. of a bridgeable polymer, e.g. polyethylene, ethylene-propylene copolymer, ethylene-vinylacetate copolymer etc, 5-250 wt. pts. of > 1 species selected from among magnesium oxide, silica, barium sulphate, and magnesium aluminate, and a crosslinking agent, e.g. 2,5-dimethyl-2,5-(tertiary butylperoxy)hexane, etc. are mixed, reacted, and pulverised into a grain size of 50 mesh to about 1 cm of particles, in a hollow or cylindrical state, and then the coarsened waste oil particles are separated.

The method can bring about the coarsening of waste oil particles easily in a very short time, and thus the waste oil particles can easily be removed. Thus, the treatment operation is very smoothly performed. 22.9.77 as 114183 (2pp117)

Appts. for desalination of sea-water using solar energy - includes air-heating chamber, air intake conduit, vanes for imparting swell motion, spray nozzle and ducting means
MATSUURA H 24.09.77-JA-114870
(14.04.79) B01d-03 C02b-01/06

An appts. for producing fresh water from sea water, comprises (a) an air heating chamber including a transparent top wall, (b) a centrally-located air intake conduit, (c) a number of vanes fixed in the chamber for imparting a swirl motion to the air introduced into the chamber through the intake duct, (d) a spray nozzle assembly for injecting sea water in atomised spray into the swirling air, and (e) a number of ducting means for introducing the heated, humidified air into a condensation unit (11) located in deep water.

Specifically the swirling air is heated by the solar energy collected through the transparent top wall and is humidified by water vapour from the atomised spray of sea water. The water vapour is recovered when the humidified air is cooled in the condensn. unit. 24.9.77 as 114870 (11pp47)

Utilisation of high pressure waste liq. - e.g. from reverse osmosis systems by heating and passage through turbine
KOBE STEEL KK 21.09.77-JA-114267
J01 (14.04.79) B01d-13

The pressure energy of a high pressure waste liq. discharged from a water treating system, e.g. a system for producing fresh water from sea water, or various waste liquid treating systems, is recovered and used for actuati of a turbine. The waste liq. is heated by passing it thro a heater before entering the turbine, so that when the he ed liquid is introduced into the turbine, the pressure of t liquid is immediately lowered so that the liq. is rapidly vaporised to actuate the turbine. The vapour leaving the turbine is passed to a condenser where the vapour is liqu ified and then drained.

The heating of the pressurised liq. enables the pressu energy of the liq. to be used in the turbine effectively reg ardless of the amt. and pressure of the liq. 21.9.77 as 114267 (4pp47)

Flocculant for use in waste water treatment - is prepd. by coatin bentonite with tar, e.g. coal or petroleum tar
INABA H 22.09.77-JA-114106
(14.04.79) B01d-21/ C02c-05/02*

Flocculant is obtd. by mixing tar with bentonite to increa the flocculating capacity of the bentonite for harmful subs ances such as surfactants and water-soluble high molecul substances in waste water, and also the associating force between the flocculated substances.

Typically, coal or petroleum tar is added to bentonite and is kneaded so the bentonite particles are coated with tar. The resulting bentonite is added to waste water cont a surfactant and a hydrophilic high polymer, and is stirre for a given time. Harmful components in waste water associate with bentonite to form micelles which further coagulate to form flocs. 22.9.77 as 114106 (2pp96)

AGEN ★ D15 39814B/21 ★J5 4047-887
Oil adsorbent prepd. from kapok fibre mixt. - contg. polyethylene, polypropylene or polystyrene as heat fusible polymer
AGENCY OF IND SCI TECH (IKED) 22.09.77-JA-114141
A35 J01 (A13 A17) (14.04.79) B01d-15 C02b-09/02 C02c-05/02

Oil adsorbent is prepd. by heating a mixt. of kapok fibre and thermofusible synthetic polymer, in which hydrocarbon series polymer consists of at least one of polyethylene polypropylene and polystyrene. The mould made from kapok fibre has excellent dimension stability, water repellency, and high strength.

In an example 5-100 wt. of fibrous polyethylene was added into 100 pts. by wt. of dried kapok cotton and was uniformly mixed by mixer. The resulting mixt. was extruded in the form of frieze through finishing machines and the frieze was set in a given thickness at 130-250 °C for 5-30 min. in heat-cure oven. 22.9.77 as 114141 (6pp96)

Silk spinning waste water treatment - by the activated sludge process and then mixing with aluminium salts
KANEBO KK 07.12.73-JA-137174
*F01 (27.04.79) *J50086-849 +C02c-01/06*

Silk-spinning waste waters are treated by the activated-sludge process and the treated waste water is then mixed with Al salts under vigorous aeration. The treated waste water has a lower COD than the water, treated by a conventional activated-sludge process.

In an example a silk-spinning waste water (pH 6.9, COD 490, colour index, 1.420) was mixed with 300 ppm activated sludge. After aeration for 4 hr. at 25° and pH 7.2, 200 ppm $Al_2(SO_4)_3$ was added and the mixt. was allowed to stand to separate the supernatant liq. and sludge. The supernatant liq. has a COD of 28 ppm and colour index 0.08. When the waste water was treated by a conventional active-sludge process, the water has a COD of 97 ppm and colour index 1.39. The colour index is log (Io/I), where Io and I are the intensities of light transmitted through the pure solvent and the test soln., respectively. 7.12.73 as 137174 C02c-1/06 (27.4.79) KANEBO KK (5pp) (J50086849)

Water titration coulometric cell - with anode and cathode, the latt
in glass tube mounted vertically in anode
LENGD ROSTORGMONTAZ 14.10.76-SU-412106
J04 R16 (07.06.78) G01n-27/42

Cell for coulometric titration of water, in analytical techniques using Fischer's reagent, comprises cathode and anode chambers with platinum electrodes. Measurement precision is increased and construction is simplifie
by making the cathode chamber as a glass tube disposed inside the anode space along the cell axis. The ratio of the dias. of the two chambers is within the limits 1:8 to 1:12. Of the two indicating electrodes, the first (the anode) and the second (the cathode) are positioned togethe
with a tube for admitting the sample being titrated and a mixer. Both electrodes are positioned vertically. This means that none of the electrolyte is mixed in the cathode space because its diameter is so small compared with that of the anode chamber.

The apparatus is used for micro- and average concentrations (i.e., from parts per thousand up to several %), as in the determination of moisture in methanol, dimethylformamide, isopropyl alcohol, etc. Tabular results are reproduced in the original showing the effectiveness of the analysis carried out by the cell.

processing system is submerged in the liq. phase and divided into two zones, one of which is moved upwards and the
other downwards, by a moving mechanism. The upwards
and downwards motion of the two zones are coupled together through the moving mechanism so that the net forces,
i.e. buoyancy and gravity, applied to the two zones are
balanced against each other.

Used for gas absorption and desorption operations, gas sepns., removal of suspensions from gas streams and simultaneous pressurisation and depressurisation of gas streams. The upwards and downwards motions assist each other to reduce the work input needed in the process. 9.6.76 as 694464 (9pp67)

Fibre separation from cellulose or paper mfr. waste water - by spraying the fibre contg. soln. against mesh allowing passage of fine fibres
JANSON B G 30.11.76-SW-013410
*F09 J01 +P43 (08.05.79) *DT2753-366 +B07b-01/04*

Fine and coarse particles suspended in liquid are sepd. in appts. which includes a vessel having liquid and air spaces, the vessel being closed except for a liquid outlet and an opening to the air space; and a spray nozzle directed upwardly to the top opening. The suspension is supplied to the nozzle and discharged through the air space towards h horizontal sieves through which the fine particles in suspension pass but the coarse particles deflected back. The upper surface of the sieve is at atmospheric pressure and is arranged to allow the fine particles and liquid to flow away. The pressure in the air space is regulated by adjusting the liquid level using an adjustable overflow.

The appts. is useful in cellulose and paper industry in extracting fibres from water. 29.11.77 as 855619 (5pp1376)

MORI/ D15 29538A/16 =US 4153-544
Activated sludge treatment of organic effluent - with sludge concn. in aeration vessel maintained at specific value related to COD lowering rate
MORINAGA ENGG KK (MORI-) 18.08.76-JA-098463
*(08.05.79) *J53025-060 C02c-01/06*

Organic waste water contg. large amts. of nitrogeneous substits. is treated by prolonged aeration in an aeration tank in which oxidn. (de)-nitrification all occur.

No excess sludge is produced and the COD (Cr) and nitrogen content is largely decreased by adjusting the dissolved O_2 content in the tank to 1.5-4.5 ppm., controlling the water temp. to 15-40°C, and maintaining the residence time of water in the tank to ≥10 days, keeping constant the activated sludge content in the tank by controlling the amt. of COD (Cr) to be removed w.r.t. equation 6 T = 33.5 x 1.058 (T-20), where T is temp. of waste water, and 6T is COD (Cr) to be removed (Kg)/ATP content in the tank (Kg)/day at T°C. Process uses only one tank. 18.8.77 as 825847 (5pp931)

REGC ★ D15 40484B/21 ★US 4153-546
Sepn of volatile solvent from soln. - in porous gas-filled matrix subjected to temp. gradient
UNIV OF CALIFORNIA 16.11.77-US-851918
J01 (D14) (08.05.79) B01d-17

A volatile solvent is sepd. from its soln. with a relatively non-volatile solute by infiltration of the soln. into a porous matrix material having ≥1% of its volume occupied by entrained gas, and maintaining a temp. difference across the matrix. The soln. becomes more concentrated at the hot side, and depeleted of slute at the cold side, and the 2 solns. are separately removed.

The process is esp. suitable for desalination of sea water, concn. of maple sugar and sepn. of alcohol from water. It uses simple appts., low temp. differences and ambient pressures. 16.11.77 as 851918 (8pp955)

Appts. for conditioning demineralised brackish or sea water - to remove carbon di:oxide and raise the pH to about 8

UOP INC 28.12.77-US-865144

(08.05.79) B01d-19/04

Appts. for conditioning demineralised brackish or sea water to remove CO_2 and increase its pH comprises a bed of limestone chips having an inlet tube extending downwardly through the bed with an upwardly opening entrance cone at its top. The water is sprayed downwardly through a wide-angle low pressure spray nozzle into the entrance cone, passes down the inlet tube to the bottom of the bed and then flows upwardly through the bed.

On striking the entrance cone the water films out slowly over the surface of the cone, releasing the bulk of the free CO_2. The dia. and depth of the bed is sufficient to ensure a water residence time of ≥2 mins. which results in the balance of CO_2 being converted to $CaHCO_3$ which is soluble and produces a pH of 8.

Used in conditioning demineralised brackish or sea water for storage and distribution. Economic system avoids the use of blowers, feeders and controllers. It is esp. suitable for use in remote areas for treating water in small quantities. 28.12.77 as 865144 (4pp67)

SAND/ ★ D15 40493B/21 ★US 4153-559

Appts. for magnetic treatment of water - to prevent build/up of scale in boilers etc., with magnet insulated from surrounding structure

SANDERSON C H 20.05.77-US-798854

(08.05.79) B01d-35/06

Water is treated using a device which includes a tubular casing of magnetic material surrounding an elongated magnet which is itself encased in a fluid-tight jacket of non-magnetic material. The jacket has tubular ends extending beyond the ends of the magnet.

The jacket is supported within the casing to form an annular chamber between them, by a pair of tapered elastic sleeves of non-magnetic material positioned over the opposite ends of the jacket. The ends of the jacket are flared outwardly to tightly compress the sleeves between the jacket and the casing. The tubular ends of the jacket ha apertures in them. Opposite ends of the casing are fixe to fluid fittings which telescopically support an outer tub ar casing of non-magnetic material.

The device is used to treat water to prevent the buil up of scale in an appts. which uses large amts. of water such as boilers, dish-washers, ice-machines, etc. The magnet is insulated from the surrounding structure. The annular treatment chamber is also free of obstructions that the flowing water has max. subjection to the magnet field. 20.5.77 as 798854 (6pp295)

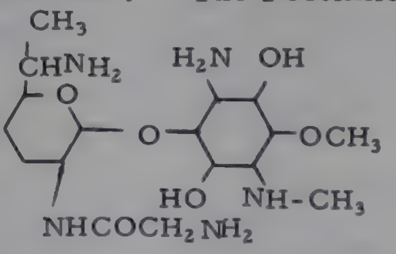
Antibiotic Fortimicin-KO - prepd. by culturing microorganism genus Micromonospora

KYOWA FERMENTATION KK 21.09.77-JA-113193

B03 (12.04.79) A61k-31/71 C07h-15/22 C12d-09/14 C12d-13

Fortimicin KO of formula (I) and its non-toxic acid addn. salts are new. The Fortimicin KO is prepd. by cultivation of microorganis belonging to the Gen Micromonospora, which can produce Fortimicin KO in a culture medium and recovering the Forti micin KO from the culture broth. Typical example of the microorganism is Micromonospora olivoasterospora MK-70 (FERM No. 1560).

(I)



The culture medium contains carbon source such as glucose, starch, mannose, fructose, sucrose, etc., nitro gen source such as peptone, meat extract, yeast extract, etc., and other additives such as table salt, potassium chloride, calcium carbonate, phosphate, etc. The cultivation is conducted in liquid phase under submerged agitated cultivation at 25-40°C at neutral pH range for 2-15 day The resulting Fortimicin KO is recovered by conventional manner. 21.9.77 as 113193 (11pp22)

Mushroom spawn prodn. - with sterilisation of nutrient and growt chambers using gaseous fumigant
LINCOLN R G 24.02.78-US-880770
P13 (08.05.79) A01g-01/04

Mushroom spawn is growth in chambers which each have a removable cover vented to atmosphere through a filter. Mushroom mycelium growth nutrient is subjected to a gaseous fumigant to sterilise it, and this is advanced to a sterile enclosure where it is mixed with sterile water.

The mixture of water and nutrient is heated within the sterile enclosure to cook the nutrient. The growth chambe and covers are sterilised and placed in the sterile enclosure where they are partially filled with the nutrient which has been cooled to ambient temp. Still in the sterile enclos ure the nutrient in each chamber is inoculated with mushroom mycelium and the covers are sealed. The chambers may then be removed from the enclosure and the myceliun allowed to grow.

Method obviates the use of an autoclave. 24.2.78 as 880770 (4pp295)

D/S: N(JA, SU, US) + E(BR, CH, DT, FR, GB).

Prodn. of a stable prepn. with immunoglobulin-binding properties comprises growing bacteria of species having immunoglobulin-binding capacity beyond that based on a reaction between antigens of the bacteria and specific antibodies directed against such antigens, in a substrate wherein the bacteria form an immunoglobulin-binding substance and then without any preceding treatment other than washing are killed. The killed bacteria are then lyophilised to give a bacteria suspension that can be reconstituted with liquid.

Suitable bacteria are Staphylococcus aureus and Streptococcus pyogenes.

Provides a simplified method of prodn. of prepns. with immunoglobulin-binding properties. Prepn. is stable, easy to transport and distribute and may be stored for a practically unlimited period without significant destruction. Prepn. may be used in radioimmunoassays, e.g. for hepatitis B-antigen or for aminoglycoside antibiotics such as gentamycin.

Acyclic carboxamides of formula (I) (R$_3$)(R$_2$)(R$_1$)C-CONR$_1$ are capable of stimulating the cold receptors of the nervous system in the surface tissues of the body when broug into contact therewith by topical application or consumpti of a vehicle contg. (I). In the formula R$_1$ and R$_2$ are (m)ethyl; R$_1$ is (m)ethyl or n-propyl; R$_2$ and R$_3$ are each 1-5C alkyl providing that $\geqslant$1 of R$_2$ and R$_3$ is branched at th C atom in the α or β position; R$_1$, R$_2$ and R$_3$ together provi ing a total of $\geqslant$5C.

A toiletry prod. comprises a topically administrable vehicle contg. (I) and odourant, antiseptic, colourant and/ or surfactant. A foodstuff or beverage prod. comprises ar orally ingestible vehicle contg. (I) and flavourant. (I) may also be used in a tobacco prod. e.g. a cigarette filter tip.

Cpds. (I) have a cooling effect similar to that of menth- ol but do not have the strong minty odour. 14.2.77 as 768219 (+16.4.73-US-351357)(9pp984)

RP ★ D17 39026B/21 ★BE -873-615

nc. sugar syrup derived from starch - contg. dextrose, levulose, altulose and maltose in specified amts.

CPC INTERNATIONAL INC 23.01.78-GB-002653
(16.05.79) C13k

e syrup compsn. derived from starch not crystallising 75% solids concn., having a dextrose equiv. of 60-90, ntains, on a dry basis, 20-40% dextrose, 20-40% levuse, 10-60% maltulose, 0-25% maltose, 0-20% saccharies having a degree of polymerisation above 2, the total etose content being 40-80%.

The syrup is prepd. by (a) first submitting a starch ydrolysate contg. $\geqslant$40% maltose and $\leqslant$5% dextrose, to an kaline isomerisation treatment to isomerise part of the altose to maltulose and obtain a 10-60% maltulose content n a dry basis. The hydrolysate is then (b) treated with lucoamylase under conditions to saccharify the maltose nd saccharide of polymerisation degree over 2 without accharifying the maltulose and obtain a hydrolysate contg. -2 maltose and $\geqslant$40% dextrose. The hydrolysate is then (c) reated to isomerise up to 50% of the dextrose into levuose.

The syrups, used in a wide variety of food products, ave excellent sugary flavours, do not crystallise or cloud t 75% solids or more, enabling easy storage and transort; the high concn. impeding bacteriological action. 2.1.79 as 873615 (20pp597)

Saturator for treating sugar beet juice - e.g. with lime and carbon di:oxide, has liquid sprayed into individual shells through which gas passes

KIEV FOOD IND TECHN 15.02.77-SU-453108
(12.06.78) C13d-03/04

Saturator for beet-sugar prodn. e.g. to purify the sugar-contg. solns. by the lime/carbonate method, has vertical body widening but at the top and a separator to remove drops fromthe gas, which exits through the pipe provided. There are means for supplying the gas and the juice.

The cleaning effect is increased together with the utilisation factor for the carbon dioxide gas, by placing vertical shells in contact with one another in the widened out top part of the body. The juice-feeder consists of sprayheads in the bottom of each of the shells. A rotatable slide-valve is installed in the gas-exit pipe.

The juice to be clarified is fed at 3-6 atm. into a manifold and thence through the sprayheads up into each of the shells. The main part of the sprayed liquid flows downwards into the body, while the peripheral liquid flows down the shell walls.

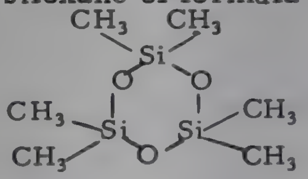
Cosmetics contg. hexa:methyl-cyclo:tri:siloxane - as volatile component, enabling cosmetics to be solidified
SHISEIDO KK 22.09.77-JA-114256
E11 (13.04.79) A61k-07/46

The cosmetics contain 20-99 w/w% of hexamethylcyclotrisiloxane of formula (I)



(I)

In the case of deodorants and aromatisers, they can be made solid by replacing 80-100 w/w% of the alcohol with (I). In the case of make-up cosmetics contg. a volatile oil as the major component they can be made as a solid stick by replacing 70-100 w/w% of the volatile oil with (I). Usually, cosmetics can be made solid by using $>$ 20% (I) as the solid oil component. When 5-70 w/w% of (I) is used with fluid oil component, the cosmetics can be made as a solid, cream, emulsion, etc. 22.9.77 as 114256 (6pp5)

SUNZ ★ D21 39705B/21 ★J5 4047-700
Compsn. for testing the activity of dental caries - contains a sugar and a pH indicator
SUNSTAR HAMIGAKI KK 21.09.77-JA-113749
B04 E24 R16 (14.04.79) G01n-31/22 G01n-33/16

The liq. compsn. contains 2.5-40 wt.% of sugar (sucrose, glucose, fructose, etc.) and 0.0001-0.05 wt.% pH indicator which discolours in the range pH 5-7 (e.g. resazurin, lacmoid, methyl red or alizarin), and being pH 6.5-7.

The activity of dental caries (i.e. the state of its progress or the possibility of it being caused) can be simply, clearly and rapidly judged. As the compsn. contains no nitrogen source, such as yeast extract, it hardly putrefies. 21.9.77 as 113749 (6pp50)

GRAC ★ D21 40549B/21 ★US 4153-680
Dentifrice contg. silica hydrogel having specified water content - as cleansing and polishing agent
GRACE W R CO 18.11.77-US-852758 (05.02.76-US-655601)
A96 (08.05.79) A61k-07/16

The dentifrice contains 5-50 wt.% of a hydrous silica gel contg. 17-32 wt.% water, and having particle size 2-30 um. The dentifrice has a radioactive dentine abrasion value of 400-705.

The gels are esp. useful in translucent or transparent dentifrices, where they give good clarity. They have good polishing properties, and high bulking value, and do not absorb large amts. of other dentifrice components. 18.11.77 as 852758 (5pp955)

WEIS/ ★ D22 39146B/21 ★DL -134-839
Sterilising thermo-labile, esp. medical and pharmaceutical equipment - with formaldehyde used as mixt. with air and steam in evacuated compartment
WEISS H 08.03.78-DL-204033
P34 (28.03.79) A61l-13/02

Finely-divided atmospheric air is passed through a heated HCHO soln. in which it is heated and enriched with a const. water and HCHO quantity. The HCHO -steam-air mixt. is passed into an evacuated sterilising compartment until pressure equilibrium is set up. The HCHO-steam-air is then evacuated from sterilising compartment and passed through a water-bath into the free atmos.

This process is repeated at least once before the HCHO-steam-air mixt. is left, for a given time, as sterilising agent, in sterilising compartment at relative air humidity 60-80%. The sterilising compartment is then evacuated and rinsed, at least twice, with germ-free heated air, esp. at 55° C.

The process is used for sterilising thermolabile articles, esp. pharmaceutical and medical equipment. Time, energy- and HCHO consumption are minimised, sterilisation is guaranteed and neutralising after-treatments with toxic chemicals are obviated. Safe sterilisation can be effected even at low temps., e.g. 20° C. 8.2.78 as 204033 (8pp200)

REWO CHEM FAB 12.11.77-DT-750732 (00.00.70-DT-039745)

E19 (D21) (17.05.79) C07c-143 C11d-01/28

The parent patent describes a process for washing a mixt. of sulpho-succinates of formulae RO.CO.CHY.CHY'.-COOM (I) and R'CO.NR''.X.O.CO.CHY.CHY'.COOM (II) (R is residue of fatty alcohols from sperm oil or spermacetic oil. R' is residue of fatty acids from the same oils. X = ≥2C opt. branched hydrocarbyl; R^4 = H, (hydroxy)alkyl with the total no. of C in X and R'' = 2-6. M is an equivalent of a water-solubilising cation suitable for washing compsns.; Y=H and Y' = SO_3M or vice versa).

The method involves saponification or transesterification (with 1-3C alcohols) of the oil; converting the liberated fatty acid (or ester) to acylalkanolamides in presence of the liberated fatty alcohol, then reaction of the mixt. with maleic anhydride and a sulphite.

In this addn., jojoba oil (A) is used in place of sperm oil or spermacetic oil.

Prods. from (A) are generally equivalent to those from sperm oil which is now in short supply. In some respects they are superior e.g. reduced foaming power and lower swelling value in synthetic detergent soaps. 12.11.77 as 750732 Add to 2039745 (7pp1251).

UNIL ★ D25 39348B/21 ★DT 2848-892

Fabric softening compsn. for cotton and synthetic textiles - contains quat. ammonium salt and choline ester salt, giving improved antistatic effect

UNILEVER NV 16.11.77-GB-047691

A97 E16 F06 (17.05.79) C11d-01/62

Laundry-softening rinse compsn. based on quat. ammonium cpds. (I) additionally contains a choline ester salt of formula $(CH_3)_3\overset{+}{N}CH_2CH_2OCOR\ X^-$ (II) (where R = 6-24C alkyl; X=monovalent anion). (II) is pref. 0.5-25 wt.% of the compsn. which may also contain a soil-release agent (III), esp. a copolymer of polyethyleneterephthalate and polyoxyethylene glycol.

Compsns. are useful not only on cotton but also on synthetic textiles where they provide an improved antistatic effect. 10.11.78 as 848892 (12pp1251).

CHEM= ★ D25 40030B/21 ★SU -615-414

Synthetic detergent powder water content determination - includes treatment with DMF, sepn. of solvent and water mixt. and titration with Fischer's reagent

CHEM IND RES INST 06.01.76-SU-316369

R16 (05.06.78) G01n-31/16

Water content of synthetic washing powder is estimated quantitatively by treating test sample with organic solvent which is then distilled off together with water. The latter is then titrated with Fischer's reagent and the amt. of water is calculated from a formula.

The accuracy of the determination is improved if the organic solvent used in the test is dimethylformamide. Water of crystallisation can be estimated also by using above solvent.

Tretyak, M.G., Makovetskaya, L.I., Bukach, L.F. Bu 26/15.7.78. 6.1.76. as 316369 (3pp938)

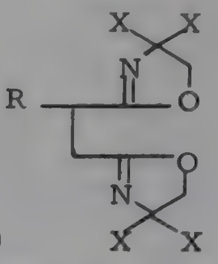
lubricants and concentrates contg. bis-oxazoline cpds. - prepd. fro hydrocarbyl-substd. unsatd. di:carboxylic acid cpd. ar aminoalcohol

EXXON RES & ENG CO 30.07.76-US-710279 (27.03.74-U 455250)

E13 H07 M14 (08.05.79) C10m-01/32

Lubricating oils contg. 0.1-10 wt.% of a bis-oxazoline cpd. of formula (I):



(I)

(where R is an 8-49C hydrocarbon ra ical; each X is 1-3C alkyl or hydroxy alkyl, ≥1 being $(CH_2)_nOH$, where n = 1-3). Specifically, (I) is prepd. by reacting 1 mole of an R-substd. 4-10 C mono-unsatd. dicarboxylic acid, ester or anhydride (II) with 2 moles o an amino-alcohol of formula: $H_2N-C(X)_2-CH_2OH$ (III) at 140-240°C. for 0.5-24 hrs. with removal of 3 moles of H_2O. Also claimed are concentrates comprising 98-45 pts. wt. mine al lubricating oil and 2-45 pts. wt. (I).

(I) can be used as antirust agents, detergents, or dispersants for mineral or synthetic lubricants, petroleum fuels and oils for drilling purposes, and also as antifouling additives for refinery oil streams or turbine oils. 30.7.76 as 710279 (+6.12.74-US-530235) (-pp367)

UNIL D25 25248A/14 =US 4153-569

Liquid detergent compsn. - contg. tetra:potassium pyrophosphate as part replacement for sodium tri-poly:phosphate

LEVER BROTHERS CO 11.10.76-GB-042175

*A97 E12 (A18 A25 E34) (08.05.79) *BE-859-321 +C11d-09/14*

An aq. built liq. detergent compsn. comprises 3-12 wt.% anionic detergent, 2-8 wt.% soap, 0.5-5 wt.% nonionic detergent, 0.1-2 wt.% copolymer and 1-25 wt.% of a mixt. of sodium tripolyphosphate and tetrapotassium pyrophosphate. The copolymer is partially esterified with nonionic detergent and neutralised. Ratio of copolymer to nonionic detergent at partial esterification is 50:1-1:2.5.

Anionic detergent is potassium (10-18C straight- or branched-chain) alkylbenzenesulphonate. Soap is potassium salt of 8-22C fatty acid or its polymer. Nonionic detergent is ethylene- or propylene oxide condensation prod. of an organic hydrophobic gp. copolymer is of maleic anhydride with either vinyl methyl ether, ethylene or styrene having specific viscosity of 0.1-4.5 in 1 wt.% w.r.t. vol. soln. in methyl ethyl ketone.

Replacement of sodium tripolyphosphate by tetrapotassium pyrophosphate does not impair the phase stability of compsn. 5.10.77 as 839535 (1p931)

HENK D25 57018A/32 =US 4153-570

Low foaming aq. detergent concentrate - comprises a mixt. of soaps, nonionic and anionic surfactants and solubilisers (BE 31.7.78)

HENKEL KG AUF AKTIEN 01.02.77-DT-703998

*(08.05.79) *DT2703-998 +C11d-09/32*

Low foaming liq. aq. washing agent concentrate comprises (a) 5-12 wt.% of a linear sodium alkyl benzene sulphonate, with 10-13C in the alkyl chain and/or of a linear sec. sodium alkane sulphonate with 14-18C; (b) 2-6 wt.% of a linear sodium alkyl polyglycol ether sulphate with 10-16C in the alkyl chain and 1-3 ethylene glycol ether gps.; (c) 2-6 wt. % of a sodium or potassium soap of mainly satd. fatty acids with 12-18C, 50-90 wt.% of which have 6-18C; (d) 15-28 wt.% of a mixt. of ethoxylated alcohols, consisting of (i) 30-50 wt.% of linear prim. ethoxylated alcohols with 16-18C and 8-12 glycol ether gps. and (ii) 30-50 wt.% of linear prim. ethoxylated alcohols with 16-18C and 3-7 glycol ether gps., both of the ethoxylated alcohols having a ratio of satd. to mono unsatd. hydrocarbon residues of 1:4 to 4:1 and (iii) 10-30 wt.% of linear and/or 2-methyl substd.prim. satd. ethoxylated alcohols with 10-15C and 4-9 glycol ether gps.; (e) 2-7 wt.% of a fatty acid diethanolamide with 10-16C in the fatty acid residue; (f) 4-10 wt.% of a toluene, xylene or isopropylbenzene sulphonate the form of the sodium, potassium or triethanolamine t; and (g) 2-7 wt.% of 1-3C alkanol, and the remainder ter and opt. other conventional ingredients. The total ight of all the anhydrous components of the concentrate nounts to 40-65 wt.%.

The agent has a strong cleaning power and prevents de- sits on the heating elements of washing machines and on e wash. 30.1.78 as 873510 (7pp)

RT/ D25 02054A/02 =US 4153-625

at exchanger cooling of neutralised sulphonation mixtures - ding slurry of anhydrous sodium sulphate before cooling

BARTON B H (PROC) 01.07.76-US-701724

*E17 +Q78 (08.05.79) *BE-856-307 +C07c-141*

An organic sulphuric and/or sulphonic acid (I) is neutralised in the presence of excess sulph(on)ating agent (II) by (a) reacting (I) and excess (II) with a Na alkaline component to form a super-satd. soln. w.r.t. Na_2SO_4 formed during the reaction and (b) cooling the obtd. mass in a heat exchanger while introducing an aq. slurry of anhydrous $NaSO_4$, in an amt. sufficient to reduce the deposition of Na_2SO_4 on the surfaces of the heat exchanger.

Prods. are used as surfactants in detergent compsns. Downtime required for removal of Na_2SO_4 is reduced. 1.7.76 as 701724 (9pp992)

CPI INDEXES

ALERTING PATENTEE INDEX (II)

Weekly by section and overall, lists all current patents in patentee code order and, within a given patentee, in earliest priority date order. The first line gives patentee code, earliest priority date, patentee name, CPI classes and finally the current patent number. The second line gives the first part of the title, followed by the accession number.

BASIC NUMBER INDEX (V)

Weekly by section and overall, lists all entries by accession number. Each heading consists of the accession number in bold, followed by the CPI section letters. There then follows a list of all the family members, commencing with the basic and finishing with the current week's patent. For each family member the CPI week of issue is quoted, and a plus sign indicates that a multiple priority has been claimed.

MANUAL CODE INDEX IN Basic Abstracts Journal only

At the start of each main group of codes, the manual code and its descriptor are printed in the middle of the column. Each sub-division of a manual code group appearing during the week is given, accompanied by its descriptor. All manual codes occurring during the week within each sub-division are then listed, with accession numbers posted against them.

In all there are about 3,600 manual codes in CPI, each one having an average of less than 200 documents assigned to it per year. The full classification is set out in the Manual Code Instruction Manual, which also contains a keyword index of terms for easy reference.

APPENDIX 1

COUNTRY COVERAGE

"Major" Countries

Covered completely in CPI and WPI from the commencement of the service except: Research Disclosure 1978, Europe and PCT 1979, Sweden transferred from "Minor Countries" 1979. Average weekly numbers are listed alongside.

Fast publishing

Belgium	180	
Europe	150	
France	740	
Germany, W. unexamined	1050	
Japan unexamined	845*	
Netherlands unexamined	240	
PCT	40	
Research Disclosure	20	
South Africa	100	
Sweden	260	
United Kingdom unexamined	600	3325

Slow publishing

Japan examined	340*	
Netherlands examined	60	
Soviet Union	1200	
Switzerland	260	
United Kingdom examined	300	
United States	1200	4375

*Only CPI coverage for Japan.

"Minor" Countries

Complete coverage, but only introduced during 1975, with exception of Italy 1978.

Fast publishing

Brazil	140	
Denmark	120	
Finland	60	
Norway	80	
Portugal	30	430

Slow publishing

Austria	125	
Czechoslvakia	180	
Hungary	35	
Israel	40	
Italy	155	
Rumania	25	560

MINOR AND MAJOR COUNTRIES

If the first publication of an invention takes place in one of the 'major' countries listed above, then this publication is called the basic patent, a WPI accession number is assigned, and this is used for all subsequent members of the family.

If, however, the first publication occurs in one of the 'minor' countries listed above, then the document is regarded as a provisional basic. No accession number is assigned, since an abstract is not provided. If this provisional basic is then followed by further family members also from 'minor' countries, these produce entries in the same indexes even though an accession number has still not been assigned.

However, as soon as a member of the family is published in one of the 'major' countries, then this is regarded as the first disclosure. An accession number is assigned, and will apply also to all the earlier members of the family (from the 'minor' countries). Hence it is possible to see, in Index V, entries where the basic has a later week number than some of its equivalents.

For CPI, if the first publication occurs in Sweden, South Africa or Japan — in the case of Non-Japanese nationals — then the document is treated as a provisional basic as outlined above. Other than for Japan where a heading is given, an Alerting abstract is included in CPI at this stage.

Subsequently, when a documentation abstract is available an accession number is assigned to the document and the abstract published in the BAJ and related products. Headings will be included in the Alerting Bulletins for Sweden and South Africa together with abstracts for the Japanese at this later stage.

Entries are included in WPI Gazettes at both stages. At the later stage both a basic and an equivalent heading will be given for each such patent number.

COUNTRY CODES

For patent number (not priority) purposes, DS distinguishes accepted West German specifications (DAS) from the unexamined applications (OLS) which are given the norma DT code. in the case of Japan J5 represents the unexamined applications, and J7 the examined of the present series.

Arrangement of Abstracts

See Appendix I for definition of 'Major' and 'Minor' Countries.

'MAJOR' COUNTRIES – An alerting abstract of every basic and examined equivalent document is provided except for equivalents from Canada, East Germany and Switzerland. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

See inside cover for further details.

ATO/ ★ D11 41302B/22 ★J5 4049-355
**odn. of noodles having fine pore structure - by kneading flour
ith sodium chloride soln. contg. hydrogen peroxide, adding e.g.
ater soluble ferric salt and heating**
SATO M 28.09.77-JA-115531
(18.04.79) A23l-01/16

nproved prodn. of dried or α-starch noodle (I) is effec-
d by (1) kneading wheat flour with NaCl soln. contg.
w conc. of hydrogen peroxide (II), (2) adding trace of
ne of cpds. (III) selected from erythorbic acid, catalase,
ulphite, water-soluble ferric salt or cysteine and (3)
eating the mixture at high temp.

(I) having fine pores can be produced and therefore (I)
an be boiled in a shorter time than other (I). (II) is de-
omposed by contact with (III) and oxygen generated. By
e generation of oxygen, many fine pores form in (I).
3.9.77. as 115531 (2pp42)

ATE- ★ D11 41693B/22 ★NL 7811-185
**ingle pack dried baking mixt. - contg. yeast and opt. chemical
sing agents, e.g. for domestic prodn. of bread, rolls, etc.**
PATENT TECHNOLOGY 11.11.77-US-850475
(15.05.79) A21d-08/04

Packaged baking mixt. for domestic use comprises a dry
ixt. of (i) 75-85% flour with a moisture content of <8%,
i) 1.75-3.25% special dried active yeast with a moisture
ontent of <5 wt.%, (iii) 4.5-7.5% of a dry filler material
ith a moisture content of <2 wt.%, (iv) ~5% dry flavour-
g ingredients, and (v) 0.5-5% dry dough conditioner and
or improving agents. The mixt. is packaged and sealed
oxidn.- and moisture protective packaging.

The prod. is supplied in a single pacakage in dry form,
hich is stable for long periods on storage. The prods.
an be used to make a wide range of yeast-risen prods. on
domestic scale, such as bread, rolls, pancakes, bis-
uits, waffles, pizza bases, etc. 10.11.78 as 011185
1pp513).

OAKE- ★ D11 42234B/22 ★US 4154-537
Continuous mixer for baking ingredients - in which gas supplied is controlled to vary mix density
OAKES MACHINE CORP 23.08.77-US-827435
(15.05.79) B01f-15/04

Continuous mixer for wet and dry ingredients comprises a gas inlet port, an ingredient inlet port and a mix outlet port. A conduit which receives the mix from the outlet port has a radiation sensitive densitometer for monitoring the density of the mix. flowing through the conduit. A valve responsive to the densitometer varies the supply of gas to the gas inlet port to control the density of the mix flowing through the conduit.

Used for premixing baking ingredients, e.g. milk, water liq. fat and flour. The mixer produces a mix. of uniform density. 23.8.77 as 827435 (4pp67)

RICH- ★ D11 42345B/22 ★US 4154-863
Intermediate moisture frozen batters - with controlled fat-sugar content, are soft at low temps. and keep without spoilage on thawing
RICH PRODUCTS CORP 24.01.78-US-871995 (28.01.77-US-763613)
(15.05.79) A21d-10/04

A microbiologically stable flour based batter comprises 15-45wt.% water, sugar in a wt. ratio w.r.t. water of 1-2:1, 2.5-30% fat, and minor amts. of salt, emulsifier, stabiliser and flavouring, provided that the amt. of fat is less than the amt. of water, and the water activity is 0.8-0.9. At least 50% of the sugar component is dextrose and fructose.

The product is storable under refrigeration, is spoonable at freezer temps., and can also be kept for long periods after thawing without bacterial spoilage. 24.1.78 as 871995 (20pp955)

D12: MEAT; FISH PROCESSING

OPP- ★ D12 40645B/22 ★BE -873-524
**evice for pressing e.g. ground meat into disc shaped prod. - has
am for compressing heat into form in mould**
KOPPENS MACHINEFAB 10.02.78-NL-001537
(16.05.79) A22c A23p

A deformable feedstock such as ground meat is pressed in-
o a disc shaped prod. by means of a machine comprising
hopper with inclined walls, a ram for compressing the
neat into the form, a scraper for scraping one wall of the
hopper and a flat plate conveyor with circular openings
forming the mould for the prod. together with a device for
pushing the finished prod. out of the mould. The ram is
fixed against one wall of the hopper, the lower end of the
wall continuing downwards to form the compression chamber in which the meat is compressed.

The ram withdraws into an offset wall which keeps the feedstock clear of the returning ram. The opposite wall of the hopper is also inclined and is equipped with a scraper working in unison with the ram so that, as the ram withdraws more product is pushed into the ram chamber by the scraper. The plate conveyor moves below the chamber in steps such that the form holes are opposite the lower end of the chamber when the ram is descending.

The filled form comes to rest beneath the pushing out device on the next downward stroke of the ram so that the finished article is pressed out at the same time as the next one is formed. 17.1.79 as 873524 (10pp1370)

TAKE ★ D12 41304B/22 ★J5 4049-365
Improving the quality of frozen ground fish meat etc. - using an agent contg. propylene glycol fatty acid ester, edible vegetable oil, sucrose and/or sorbitan fatty acid ester etc.
TAKEDA CHEMICAL IND KK 26.09.77-JA-115818
(18.04.79) A23l-01/32

An agent (I) for improvement of quality of frozen ground fish meat (II) or fish meat paste (III), is prepared by emulsifying (i) 1 wt. part of propylene glycol fatty acid ester (IV) which is liquid at room temp., (ii) 0.15-20 wt. parts of edible vegetable oil (V) which is liquid at room temp., (iii) 0.015-2.5 wt. parts of sucrose fatty acid ester and/or sorbitan fatty acid ester and (iv)1- 30 wt. parts of one or more of D-sorbitol, D-mannitol and others.

Whiteness and elasticity of (II) or (III), can be increased by the present method. 26.9.77. as 115818 (6pp42)

LEME= ★ D12 41783B/22 ★SU -599-967
Food prod. e.g. meat slicer - has feeding conveyor and carriage with needles to hold meat as it passes across line of rotating knife
LENGD MEAT IND PROD 07.06.76-SU-369414
P62 (10.05.78) A22c-17 B26d-04/24

The slicer includes a cutting unit having intermittent mo-ion, feeding conveyor with needles, and motor.

The prod. is more reliably held during the cutting rocess by adding a carriage on which is a support and eedles on which the product is impaled. The feeding onveyor is located opposite the carriage with the latter stablished so that it can move reciprocally across the irection in which the product is moving and parallel to he plane of rotation of the knife. The support has a rack ith guiding holes for the needles and which is spring-oaded. Prior to starting, the carriage is moved to the urthest position away from the knife. The meat product s impaled on the needles, either manually or by supplying it on the conveyor.
Molozhavtsev, L.G., Fokin, V.I. Bul. 12/30.3.78.
7.6.76. as 369414 (6pp29)

FISH= ★ D12 41790B/22 ★SU -604-550
Small smoked fish e.g. sprats filleting and packing prodn. line - which uses three conveyors and fillet row arranger prior to placing inside containers and sealing
FISHING FLEET DES 01.03.76-SU-332819
Q31 (26.04.78) A22c-25/14 B65b-25/06

The machine comprises conveying unit, head-and-tail-removing mechanism, means to form the fish into single-layer rows, pusher to move the assembled fish along, and mechanism to pack the fish into the containers.

The productivity is increased, by making the conveying unit with three separate but kinematically-connected conveyors one after the other. The first two have cells for the sticks and the fish, the cells in the second being arranged at a pitch equal to the fish length at least. The third conveyor is directly in front of the device which forms the portions of fish, and this is capable of rotating through 180°.

The attachment to pack the rows into the container is mounted on a plate which can move backwards and forwards. Between the second and third conveyors are chutes with channels sloping downwards, with the head-removing mechanism below the lower arm of the second conveyor.
Stolin, L.M., Mikhailov, G.V., Osovets, V.I. et al. Bul 16/30.4.78. 1.3.76. as 332819 (8pp29)

STOR- ★ D12 42141B/22 ★US 4153-971
Stunning trough for immobilising poultry before slaughter - with insulating end plates carrying bus/bars and supporting electrode rods
STORK-GAMCO INC 02.02.78-US-874336
(15.05.79) A22b-03/06 A22c-21

The stunning trough has non-conducting upright end plates, with buss bars secured to them. Electrode rods extend between the end plates and alternate rods have corresp. ends electrically connected with one buss bar, while the remaining rods have their opposite corresp. ends connected to the other buss bar.

The stunning trough is mounted in a non-conducting shell which has non-conducting end caps covering the buss bars and exposed terminal ends of the rods.

The appts. is used to stun poultry to immobilise them prior to killing. The appts. is efficient and yet the operator is protected against electric shock. 2.2.78 as 874336 (5pp295)

STOR- D12 43142U/31 =US 4153-972
Poultry processing machine - for prodn of ovenready/dressed birds
STORK-GAMCO INC (GAIN) 12.01.72-US-217206 (18.06.75-US-587838)
*(15.05.79) *DT2301-534 A22b-03/08*

Poultry eviscerating appts. includes a vacuum tool insertable via a pre-cut opening into the body, the tool being reciprocally and selectively movable on a carriage device for movement into and out of the cavity.

The tool is divided into ≥ 2 separate longitudinal passage ages through which matter from the body is drawn by the vacuum. The tool has a spacer to maintain an air space between the tool and the body to prevent collapse of the body. The appts. provides for accurate removal of the internal matter and can operate at process-line speed.
18.6.75 as 587838 Div ex 3908229 (16pp1379)

ARMO D12 17707B/09 =US 4153-9
Sterilisation of rotating meat saw - and arcuate guard using jets hot water
ARMOUR CO 26.01.76-US-652405 (14.06.77-US-806468)
*P62 (15.05.79) *US4139-926 A22b-05/20 +B26d-07/10*

Appts. for cutting materials, e.g. animal carcases, includes a cutting blade and a guard, together with a devi for directing hot water at ≥ 180°F at the blade and guard between cutting operations.

The blade is disc-shaped and the guard arcuate. The water sterilises the blade and guard to prevent contamination of the material being cut. The parent is concerned with a process using the above appts. 17.2.78 as 878697
Div ex 4139926 (4pp1379)

HOLT ★ D12 42142B/22 ★US 4153-97
Hamburger patty prodn. in reciprocating mould - filled from hopp with discharge auger and pressure pad
HOLLYMATIC CORP 16.09.77-US-833899
(15.05.79) A22c-07

Ground raw meat is removed from a hopper and delivere to a pressure chamber by an auger. A ram reciprocates with the pressure chamber to transfer the meat into a mould cavity within a reciprocating plate.

During the compression stroke of the ram, excess meat fromthe chamber is returned to the hopper having passed the auger. A baffle is located diametrically opposite to the pressure chamber to control the pressure while meat is thus being returned to the hopper. 16.9.77 as 833899 (10pp295)

JOHJ ★ D12 42143B/22 ★US 4153-97
Cutting thin walled tube into segments - by unshirring a portion ar parting while tubing is continuously advanced
DEVRO INC 23.01.78-US-871671
(15.05.79) A22c-13

Shirred casing is advanced continuously along a mandrel and passes beneath a segmenting station. An extendible arm grips a portion of the casing and advances it downstream at a greater rate than the casing feed so that a section becomes deshirred. A second arm then advances the unshirred section to lie between cutter jaws which cut-off a length of casing. Finally the length of casing is carried along the mandrel and discharged.

The appts. cuts shirred casing into shorter segments. By deshirring the casing before it is cut, a regular end to the casing results without the formation of torn sections. 23.1.78 as 871671 (11pp295)

UNIC D12 68906A/39 =US 4154-8
Articles mfr. from collagen, esp. sausage wrapping - contg. wate soluble anionic polysaccharide as dehydrating agent
UNION CARBIDE CORP 22.03.77-US-780224
*A97 (A11) (15.05.79) *BE-865-144 +A23l-11/31 D01f-04*

A shaped collagen article is produced by dewatering the shaped article prior to the final drying step by immersio in an aq. dewatering bath contg. ≥ 0.01wt.% w.r.t. bath a water-soluble anionic polysaccharide.

Polysaccharide used is naturally occurring or formed by de-esterification of polysaccharide esters of polygalacturonic acid, sodium carrageenan, gum arabic, pectic acid pectic, low methoxyl pectin, sodium polypectate or chondroitin sulphate. Collagen article is subjected to fina drying.

Prod. is used in tubular structures used as sausage and frankfurter casings. 22.3.77 as 780224 (5pp931)

Cheese prodn. with min. protein loss - by setting cheese factory milk to final dry solids and protein content by adding milk protein materials

BRIEL D C & CO GMBH 15.11.77-DT-750950

(23.05.79) A23c-19/02

In cheese prodn., the addn. of milk protein or milk-protein-contg. materials adjusts cheese factory milk compsn. to the final dry solids and cheese protein content.

Raw cheese compsn. can be adjusted by dosage of components in cheese factory milk. Water or aq. solns. may be added to control ratio between cheese components. After homogenising, the compsn. can be soured and coagulated.

The cheese yield can be increased by ≥25%. Whey and waste water formation can be prevented or controlled to 0-80% w.r.t. cheese factory quantity. Protein losses are negligible to nil. 15.11.77 as 750950 (4pp200)

BADI ★ D13 40773B/22 ★DT 2751-768

Feedstuff additive for monogastrenes e.g. piglets - contains green fodder, esp. grass, and aliphatic carboxylic acid and/or salt preservative

BASF AG 19.11.77-DT-751768

C03 (23.05.79) A23k-01/16

Feedstuff additive for monogastrenes contains comminuted green fodder, pref. grass or opt. sugar beet leaves, admixed with 1-5 wt.% organic acid and/or organic salt having a preserving activity. Pref. preservative is an aliphatic 1-4C carboxylic acid and/or its salt, partic. propionic acid and/or a propionate.

The fodder additive may be given to pigs and poultry, esp. piglets and pigs for fattening. Acid and/or salt preservative addn. reduces green fodder harvesting to 3-4 cuts/year, whereby a const. nutritional value of fodder can be achieved. Preservation, e.g. in silos, causes no problems. Propionic acid kills or inhibits microorganism growth and increases green fodder energy content. Raw fibre components can be left out of diet. The preserved fodder is digested well as a porridgy paste, and its digestibility is higher than that of hay, e.g. the digestibility of grass paste + 1 wt.% propionic acid is 74.4% compared to 69.7% for hay. 19.11.77 as 751768 (14pp200)

Chlorophyll contg drink from dried wild rice leaves - formed pressing and heating the leaves so that the nourishment in the preserved

NIPPON SHIZEN KAGAK 29.08.74-JA-098333

*(08.05.79) *J51026-255 A231-02/38 +A23f-03 02*

A nourishing drink is prepd. from the fibrous leaves of wild rice which are shredded into pieces 1-2 cm in leng and then steamed at 100°C to 20-60 seconds such that th green colour of the leaves is not affected. The steaming deactivates the oxidising enzyme contained in the living leaves and the leaves are softened. They are then rapidl air-cooled and twisted with mixing to level the moisture content, The leaves are treated at 30-40°C for 8-12 minutes and pressed to reduce the moisture content to Ca. 68 wt. %. The resulting prod. is a dark-green matte having a strong scent of grass-leaves. Finally, the pro is further dried and pressed to reduce the moisture content to 4-5 wt. %.

The method ensures the nourishment contained in the leaves is not destroyed. The prod. is enriched with chlorophyll, and is suitable for the prepn. of drinks e. g. green-tea. 29. 8. 74 as 098333 A231-3/02, A23f-2/38, (8. 5. 79) NIPPON SHIZEN KAGAK (4pp) (J51026255)

Stretching coagulable extrudate in coagulating bath - whose contents are forced to vortex to stretch extruded fibres

STANDARD OIL CO (IND) 20.03.78-US-890579

F01 (15.05.79) A23j-03

A coagulable extrudate is injected into a vortexing coagulating bath so that it is generally stretched along the spiral path of the vortex. The stretched extrudate is collected near the apex of the vortex. Pref. the extrudate is an extruded dope comprising single cell protein organisms such as yeast.

The vortex may be produced by agitation within the bat or by draining the bath out through an aperture at the bottom of the bath container. Alternatively the stretching may be produced by injecting the extrudate into a bath contained in an annular space formed between a stationary cylinder and a concentric rotating conical segment. The extrudate is subjected to increasing velocity and is gradually stretched as it spirals towards the apex of the conical segment.

The method is used to prepare a fibrous prod. by extru-ion of a dope into a coagulating bath. The fibres are stretched without the use of rollers or gaseous moving agents. 20.3.78 as 890579 (8pp295)

Horizontal cylindrical rotary drum for soaking potatoes etc. - in treatment liq. of controlled concn. for controlled duration
MORILLON T 30.07.76-FR-024009
(27.04.79) A01n-03 A23b-07

The machine treats vegetables, fruit etc. by soaking them in a bath of liq. through which they are continuously conveyed. The prod. is fed into a horizontal, cylindrical, rotary drum which has a perforated shell. The lower part of the shell is immersed in liq. in a treatment bath. Inside the drum, a coaxial, helical scroll conveys the prod. through the liq. as the drum rotates. At the discharge end of the drum, radial paddles lift and drain prod. which is delivered for packing. The depth to which the drum is immersed in the liq. is approximately equal to the effective radial width of the conveying scroll.

Below the drum, a make-up tank is pref. installed to contain concentrated treatment liq. which is added continuously to the bath to keep up liq. strength in operation. The make-up liq. is transferred by a bucket elevator driven from the rotating drum.

Drive to the rotary drum is pref. via belt loops in which the ends of the drum are suspended.

The treatment is usually to protect the prod. from disease, rotting, pests, etc. during storage prior to use as seed or food. Fully mechanised soaking is of controlled duration, depth and concn. excellent penetration of soiled vegetables, and no damage to prod. are other advantages. 30.7.76. as 024009 (7pp448)

king food in columns of hot gas - directed perpendicularly to the d surface at controlled rate, giving local surface heating

SMITH D P 19.05.76-US-687982

(15.05.79) A23l-01/ A23l-03/32*

od is cooked by forming columns of hot gas and directing se perpendicular to the surface of the food. The jets pinge on discrete points on the food surface to remove undary air and moisture to provide local heating. The d is moved slowly w. r. t. the jets which thus sweep over food to heat the entire surface.

The velocity of the hot gas is controlled such that it vapourises moisture on the surface of the food faster than the moisture comes to the surface of the food from it interior.

The method heats the surface of food e. g. pizzas or precooked chicken portions. It may be used in conjunction with a microwave heater which cooks the interior of the prod. The discrete jets raise the temp. of individual points on the surface to the value at which the surface browns. 19. 5. 76 as 687982 (16pp295)

ckening activated sludge - by adding cationic polyelectrolytes d draining through an endless chain belt

SIMON HARTLEY LTD 25.05.78-GB-022250

(16.05.79) B01d C02c

ocess intended to attain a concn. by wt. of 5% of solid atter by the addn. of a cationic polyelectrolyte. Flocculation develops and the slude is deposited on a surface rough which the liq. can flow freely. The sludge is then iminated from this surface.

The sludge to be thickened is introduced into the appts. the pipe where it meets the polyelectrolyte from pipe. he treated sludge passes, for a suitable interval of time to the holding tank where the flocculation develops. It en leaves by the overflow, down the plane to be deposited the moving belt. As the latter passes between the rollrs the liq. flows through the belt onto the guide plates. eliminates traces of residual sludge from the belt when e latter passes between rollers and collects on the guide ate to be directed into the gutter and overflow to the rain. Some of the liq. can be passed through the valve nd the pipe into the hopper so that some of it may be retroduced into the thickened sludge if the latter is too ick for a subsequent process.

The addn. of the polyelectrolyte allows the sludge to ow freely and increases the amt. of solids to about 5% by t. The appts. is relatively cheap and simple. 26. 1. 79 s 873750 (8pp519)

reating waste water by activated sludge process - with preliminary
ermentation in basin with controlled residence time
AIR LIQUIDE L' 22.08.77-FR-025504
(27.04.79) C02c-01/06 C02c-05/10
he process uses a preliminary fermentation zone and
hen an activated sludge treatment zone. The residence
ime in the preliminary zone is controlled according to
he pollutant charge of the water so that the multiplica-
ion of bacteria carries onto a level corresp. to the ex-
ponential phase.
The process is carried out in an installation compri-
sing 2 basins. The first fermentation basin bas means
o vary the volume of water it contains according to the
pollution level. The first basin is linked to the second
activated sludge basin by a conduit opt. provided with an
adjustable valve, and opt. by a weir.
The process avoids the risk of destruction of the ac-
tivated sludge, partic. protozoa, by, for example, eff-
luent from distilleries and paper-making. It enables
great adaptability and economy in oxygen consumption.

Removing nitric acid type nitrogen from waste water - by absorbing with ion exchange resin and treating the spent resin with BOD of the water
SHINMEIWA IND KK 29.09.77-JA-117706
(20.04.79) C02c-05/08

The method comprises adsorbing nitric acid type nitrogen contained in waste water with an ion exchange resin, and treating the waste resin with BOD of the waste water used as bacteria for regeneration of the resin.

Specifically, waste water is introduced from an adjusting tank through air oxidising tanks into separating tank separately obtain crude water and sludge, where one portion of the sludge is recycled. The crude water is introduced through an aggregating tank and a valve into one ion exchanging tank to obtain treated water through a valve. One portion of the waste water is introduced from a tank through another and valves into the other ion exchanging tank positioned in parallel with the first ion exchanging tank to regenerate the waste ion exchanging resin with BOD of the waste water. 29.9.77. as 117706 (4pp51)

By means of this auxiliary guide system, the attitude changes of the teeth are smooth and continuous enabling larger teeth to be used without causing undue mechanical strain due to the knocking of teeth against guide lugs. 8.10.69 as 015180 (10pp1370).

ANON ★ D15 41701B/22 ★RD-181-011

Ultrasonic monitor for centrifugal separator for effluent - with trips relay to initiate emptying of rotor when attenuation of ultrasonic signal indicates too much sludge in liq. emerging from rotor

ANONYMOUS 20.04.79-RD-181011
*(10.05.79) C02c-00/**

When the quantity of sludge in the rotor becomes excessive efficiency falls and the proportion of sludge in the emergent liq. rises, so the rotor must be emptied. To imitiate emptying of the rotor automatically, the sludge content of the emergent liq. is detected ultrasonically by means of a transmitter crystal and a reciver crystal on opposite sides of the liq. stream. During normal operation, the signal from the receiver crystal is sufficient to hold a relay open. When the sludge content rises, the signal is attenuated and the relay eventually closes, initiating emptying of the rotor.

To allow adjustment of the sludge content value that trips the relay, a variable-gain amplifier may be connected between the receiver crystal and the relay. Alternatively, several relays with different tripping values may be used.

The system comprises ≥ 4 serially connected tank structures each forming an enclosed chamber. An inlet pipe brings raw sewage into the top of the first tank, and an outlet pipe from the last tank is positioned lower than th inlet pipe. Each tank is connected to its adjacent tank by transfer connection each of which comprises ≥ 1 horizont transfer pipe disposed at the upper level of its respectiv tank but slightly below the normal level of the preceding tank.

Each horizontal transfer pipe includes a narrow slot above the bottom of the pipe but below the centreline of t pipe. Accumulated scum is drawn through the slot and is discharged into the next tank.

The septic tank system is used in areas not connected mains drainage. Scum is removed from the scum-liq. int-face to mitigate against the build-up of a scum barrier preventing gas release from the contents of the tank. 30. 3. 78 as 891551 (6pp295)

nidia material of helminthosporium fungi - is prepd. by surface lture method in a sunflower husk based medium
AGRIC MICROBIOL RES (PLAN=) 09.11.76-SU-420726
C03 (20.04.78) C12k-01

he innovation relates to agricultural microbiology. It is sed in the prepn. for the artificial infection of plants eing tested for resistance to corresponding diseases. condidial material of Helminthosporium genus fungi is roduced by the surface cultivation method in a relatively w value medium prepd. from sunflower husks. The ethod is simple and no special equipment for the mass rodn. is required. Materials used are readily available nd cheap. Apart from starch, no other nutritional ingre- ients are required. The yield of condidia is high (15- 5% expressed on the total wt. of the prepn.) and the dry aterial retains its viability and virulence for a long me under normal storage conditions at room temp.

The nutrient medium is prepd. by grinding air-dried unflower husks, adding 2-2.5% ammonia soln. auto- laving (30 mins. 1 atmos), washing with water until pH f the washings is 7.0-7.5, air-drying, adding a soln. ontg. Capek mineral medium with added 0.4-0.6% tarch, The latter inhibits the growth of the fungi but promotes the growth of the condidia.

Compact gravity settlement clarifier partic. for sugar juice - uses annular baffle elements providing zigzag decanting passages
FIVES-CAIL BABCOCK 23.08.77-FR-025648
(27.04.79) B01d-21/ C13d-03*

The clarifier comprises a vertical, cylindrical vessel with a tangential inlet at the top into a foam degassing chamber. The chamber has a downpipe extending axially to a low part of the vessel. Clarified liq. is drawn off at the top of the vessel while sludge is drained away at the bottom.

Decanting baffles take the form of annular elements fitted coaxially around the downpipe. Each element comprises a set of spaced coaxially superimposed, conical or pyramidical frusta. Inclined passages are bounded by sloping faces of adjacent frusta.

Passages in adjacent elements are pref. inclined in opposite directions, i.e. by inversion of every other element w.r.t. its neighbour. The outlet end at the bottom of the downpipe is pref. divergent, e.g. bellmouthed. A rotary, sludge-collecting scraper is pref. fitted below the downpipe outlet. Provision for recycling part of the drained sludge is pref. provided, returning into the unclarified liq. inlet into the foam chamber.

Used in clarifying liqs., partic. juice in sugar refineries. Simplicity and economy of construction combined with a high ratio of throughput capacity to installation space requirement are provided. 23.8.77. as 025648 (9pp448)

Continuous starch gelatinisation process - with use of steam and Venturi mixing effect to give prod. without slurry formation

GENERAL FOODS CORP 07.11.77-CA-290374
(31.05.79) C13l-01/08

Starch-contg. material is continuously gelatinised by feeding it with steam into a mixing chamber. They are mixed by using a Venturi effect to cause turbulence and uniform mixing. The material reaches a temp. sufficient for gelatinisation, while the total water (steam and starch-contg. material) is sufficient to permit gelatinisation without formation of a slurry. Then gelatinised prod. is withdrawn from the mixing chamber.

Minimum amt. of equipment is necessary, and fast flow rates are possible. Materials that may be treated include raw starches, flours, animal feed meals, oil-contg. pastry mixes, etc. 31.10.78 as 042652. (5pp1248)

Hair treatment compsn. - comprises olefinic sulphonic acid cpd. vinyl ester copolymer or its partly saponified prod.
NIPPON SYNTH CHEM IND 26.09.77-JA-115694
A96 (A14) (18.04.79) A61k-07/06

Hair treatment agent is composed of (A) a copolymer of an olefin sulphonic acid cpd. and a vinyl ester with 0.5-5 mol.% olefinic sulphonic acid or (B) a prod. produced by saponifying ⩾50 mol.% of the vinyl ester component in the copolymer (A). The olefin sulphonic acids are e.g. ethylene sulphonic acid, aryl sulphonic acid, or their salts with K or Na. The vinyl esters are e.g. vinyl acetate, vinyl propionate or vinyl esters of satd. branched fatty acid. The copolymer is e.g. polymerisation degree 80-500. 26.9.77. as 115694 (4pp43)

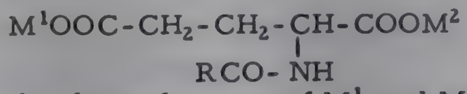
Dentifrice compsn. - contg. mono- or di-alkali metal salt of a N contg. fatty acid-acyl glutamic acid
LION DENTIFRICE KK (AJIN) 27.09.77-JA-115800
E12 (18.04.79) A61k-07/22

Dentifrice compsn. (I) contains a mono- or di-alkali metal salt (II) of a N-contg. fatty acid-acyl glutamic acid of formula:



$$M^1OOC\text{-}CH_2\text{-}CH_2\text{-}\underset{\substack{|\\ RCO\text{-}NH}}{CH}\text{-}COOM^2$$

In the formula, one of M^1 and M^2 is H and other is alkali metal, or both of M^1 and M^2 are alkali metals,and RCO- is the mixed fatty acid gp. composed of (1) 65-85 wt.% of a mixt. (III) of 10-30 wt.% of coconut oil and 90-70 wt.% of hardened tallow fatty acid and (2) 35-15 wt.% of an unsatd. fatty acid (IV) such as oleic acid.

(I) does not stimulate mucous membrane in the mouth and is safe to humans. (I) has high washing effect depending on its high permeability.

(II) is pref. produced by acylation of the amino gp. of mono- or di-alkali metal L-glutamate with the fatty acid mixt. of (III) and (IV). The content of (II) in (I) is pref. 0.1-5 wt.%. 27.9.77. as 115800 (9pp42)

Removing bacteria from liq. - using ion exchange resin and submicron filter
ROHM & HAAS CO 23.11.77-US-854306
(30.05.79) B01d-35 B01j-01/06 C02b-01/40
D/S: E(DT, FR).

Bacteria is removed from a liq. by passing the liq. through a bed of ion exchange resin having an av. pore dia. of 8000-500,000 Å. Effluent from the bed is passed through a submicron filter having an av. pore dia. of at least 0.03 µ and a max. pore dia. of 1 µ. A pressure tight relationship is maintained between the filter and the bed so that when the capacity of the resin for removing bacteria becomes exhausted and the bacteria passes to the filter to block it, the pressure rises to a level sufficient to reduce the flow of liq. leaving the filter.

The process is used for purifying water, esp. in sterilising soft contact lenses. The reduction in liq. flow from the submicron filter indicates exhaustion of the ion exchange resin bed and provides a safety factor against passage of bacteria into the effluent liq.

22.11.78 as 101440 (18pp67).

Surgical immobilising bandage of good mouldability - contai
aliphatic polyester e.g. poly:hexa:methylene adipate
TOKYO EIZAI LAB 17.11.77-JA-138244
A96 (A23) (31.05.79) D06m-15/48

A bandage contains as its main constituent an aliphati
polyester, or mixt. of such polymers, synthesised fr
aliphatic diols and satd. dicarboxylic acids. It is pre
by impregnating an elastic fabric, pref. a tricot or ru
er-threaded fabric, with a compsn. contg. the polyest
together with colourants and/or fillers.

Pref. polyesters are polyhexamethylene adipate an
suberate. Their mol.wt. is pref. $\not< 10,000$, m.pt. $\geqslant$
and second order transition pt. < -20°C.

The prod. is a surgical immobilising bandage, use
the formation of orthopedic casts. The bandage of thi
vention is free of the disadvantages mentioned above,
is of good mouldability. If it is required to vary the
of the cast later, this can be done by partial heating.

Deodorising adsorbent used e.g. in a piggery - is mfd. by impregnating wood chips with sodium bi:carbonate soln., washing with water and drying
IMAMURA T 24.12.76-JA-154927
*P34 (08.05.79) *J53078-987 +B01d-53/34*

Adsorbent is mfd. by immersing wood chips or wood dust in sodium bicarbonate soln., boiling or digesting it, washing with water, dehydrating, and drying. Useful for removal of bad smells from e.g. excretion in hog yard, poultry yard, etc.

Specifically wood chips and wood dust are immersed in 1% sodium bicarbonate aq. soln. boiled or digested for 1-2 hrs. at about 10°C, washed thoroughly with clean water, dehydrated, and dried. Sodium bicarbonate soln. permeates rapidly into the structure of wood chips or dust to swell the cell membrane and expand the pores. Soluble components to cold water are organic salt, sugar, gum, pectin-like substance, galactan, tannin, dye, etc., and alkali- soluble components, oil, fat, wax, resin essential oil, lignin and hemicellulose are extracted at least partially by hot alkali treatment. The adsorbent has very large surface area for adsorption. 24.12.76 as 154927 B01d-53/34 (8.5.79) IMAMURA T (3pp) (J53078987)

Flaking mill with adjustable roller spacing - maintained by hydraulic and pneumatic rams providing shock absorber

HUNT MOORE N ASSOC 19.12.77-US-861871

P41 (15.05.79) B02c-04/32

A flaking mill comprises a pair of rollers which are attached to pivots so that the roller spacing can be adjusted. A serially connected hydraulic and pneumatic ram bias the rollers together until a spacing set by a limit stop is reached. The pressure in the pneumatic ram is greater than in the hydraulic ram and significantly above the normal operating pressure of the rollers of the mill. If an obstruction passes between the rollers the hydraulic ram yields and the pneumatic ram acts as a shock absorber. Pref. a hydraulic damper is provided on the pneumatic ram.

The appts. flakes oil seeds. Obstructions can pass between the rollers. 19. 12. 77 as 8618 71 (7pp295)

MANUAL CODE INDEX IN Basic Abstracts Journal only

At the start of each main group of codes, the manual code and its descriptor are printed in the middle of the column. Each sub-division of a manual code group appearing during the week is given, accompanied by its descriptor. All manual codes occurring during the week within each sub-division are then listed, with accession numbers posted against them.

In all there are about 3,600 manual codes in CPI, each one having an average of less than 200 documents assigned to it per year. The full classification is set out in the Manual Code Instruction Manual, which also contains a keyword index of terms for easy reference.

APPENDIX I

COUNTRY COVERAGE

"Major" Countries

Covered completely in CPI and WPI from the commencement of the service except: Research Disclosure 1978, Europe and PCT 1979, Sweden transferred from "Minor Countries" 1979. Average weekly numbers are listed alongside.

Fast publishing

MINOR AND MAJOR COUNTRIES

If the first publication of an invention takes place in one of the 'major' countries listed above, then this publication is called the basic patent, a WPI accession number is assigned, and this is used for all subsequent members of the family.

If, however, the first publication occurs in one of the 'minor' countries listed above, then the document is regarded as a provisional basic. No accession number is assigned, since an abstract is not provided. If this provisional basic is then followed by further family members also from 'minor' countries, these produce entries in the same indexes even though an accession number has still not been assigned.

However, as soon as a member of the family is published in one of the 'major' countries, then this is regarded as the first disclosure. An accession number is assigned, and will apply also to all the earlier members of the family (from the 'minor' countries). Hence it is possible to see, in Index V, entries where the basic has a later week number than some of its equivalents.

For CPI, if the first publication occurs in Sweden, South Africa or Japan — in the case of Non-Japanese nationals — then the document is treated as a provisional basic as outlined above. Other than for Japan where a heading is given, an Alerting abstract is included in CPI at this stage.

Subsequently, when a documentation abstract is available an accession number is assigned to the document and the abstract published in the BAJ and related products. Headings will be included in the Alerting Bulletins for Sweden and South Africa together with abstracts for the Japanese at this later stage.

Entries are included in WPI Gazettes at both stages. At the later stage both a basic and an equivalent heading will be given for each such patent number.

COUNTRY CODES

For patent number (not priority) purposes, DS distinguis accepted West German specifications (DAS) from unexamined applications (OLS) which are given the nor DT code. in the case of Japan J5 represents unexamined applications, and J7 the examined of present series.

Arrangement of Abstracts

See Appendix I for definition of 'Major' and 'Minor' Countries.

'MAJOR' COUNTRIES – An alerting abstract of every basic and examined equivalent document is provided except for equivalents from Canada, East Germany and Switzerland. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

See inside cover for further details.

A	Polymer Chemistry
A+	Polymer Applns.
AE	Polymer & General Chemistry

Copies of Specifications may be ordered from our PATENTS SUPPLY DIVISION.

PATENTS COPY SERVICE

he Patents Supply Division has been organised to give an extremely rapid turnround at low prices. The schedule f prices and turnround times, together with the methods of ordering and payment, is given below.

CHEDULE OF PRICES AND TURNROUND TIMES AS FROM JUNE 1979.

COUNTRY	DELAY from receipt of order within:	COST inclusive of (airmail) postage	SURCHARGE if applicable	NOTES
BELGIUM EUROPE PCT	1 day	per page £0.11, $0.29 or Y84	—	Photocopies
FRANCE	2 weeks	per patent £1.50, $3.40 or Y890	1p, 2c or 8Y per page if more than 20 pages	Printed copies. Delay reduced to 4 days for double the normal cost.
GREAT BRITAIN	2 days	per patent £1.25, $2.80 or Y770	—	Printed copies
JAPAN	4 days	per patent £0.90, or $2.00	—	Photocopies
NETHERLANDS	1 week	per patent £1.45, $3.30 or Y800	1p, 2c or 8Y per page if more than 20 pages	Printed copies
SOUTH AFRICA	3 weeks	per page £0.27, $0.60 or Y170	Minimum charge equivalent to 5 pages	Photocopies
UNITED STATES	4 days	per patent £1.20, $1.90 or Y720	11p, 20c or 70Y per page if more than 15 pages	Photocopies
WEST GERMANY	2 weeks	per patent £1.60, $3.65 or Y900	1p, 2c or 8Y per page if more than 20 pages	Printed copies. Delay reduced to 4 days for double the normal cost.
CANADA SWITZERLAND EAST GERMANY SOVIET UNION	4 days	per page £0.16, $0.40 or Y100	Minimum charge equivalent to 5 pages	Photocopies

* Copies of specifications can now be supplied for Austria, Brazil, Denmark, Finland, Hungary, Israel, Italy, Norway, Rumania and Sweden. Prices comprise actual costs plus a nominal handling fee. *

METHOD OF ORDERING

(i) By books of standard order forms available upon request, or

(ii) By letter, or

(iii) By telex, to cut postal delay. French and West German patents ordered by telex are processed as rush orders at double normal cost (see NOTES above) unless normal service requested.

METHOD OF PAYMENT

(i) On receipt of bi-monthly invoices, or

(ii) By charges against deposit accounts. Subscribers are encouraged in their own interest to open deposit accounts with us so as to avoid the need for frequent payments.

Please address orders and enquiries to the Patents Supply Division.

D11 25939U/19 =DS 2250-119

figure moulding machine - for biscuitdough marzipan or the

AGSE BAKKERIJMACH (HAA -) 19.10.71-NL-014380
31.05.79) *DT2250-119 *A21c-11/02*

chine to produce shapes of dough or marzipan con- of a feed roll and a form roll, the former with cor- ons and the latter with the shapes in negative relief. er with the shapes is sliced off on leaving the roll y a knife blade which is supported at both ends by prings to form a parallelogram linkage. A drive eciprocates the knife blade at a frequency which is compared with the speed of the rolls.

his is a simple method of producing dough shapes a minimum of distortion. The whole device is easy to . 13. 10. 72 as 250119 (7pp39).

★ D11 42498B/23 ★DS 2823-865

e iron roller - with inward inclined running surface on ining rail surface

BENSTREIT GMBH 31.05.78-DT-823865
(31.05.79) A21b-05/02

for the baking of waffles in an endless chain of hing- affle irons has rails with an inward inclined conical d of 7-35 (10)° for the rollers of the irons. The rollers a conical running surface with the same inclination eir generating line to the horizontal.

rrangement ensures an automatic central alignment the chain of waffle irons. Thermally induced elongat- can be compensated for, and the whole system is sim- and suffers little wear. 31. 5. 78 as 823865 (7pp39).

K ★ D11 42533B/23 ★DT 2752-464

omatic baking plant for Arabian flat-cake bread - avoids turning ough portions and yields prod. resembling hand-made goods

VINKLER FA KG 24.11.77-DT-752464
(31.05.79) A21c-13/02

evice dispensing roughly spherical portions of dough, a -rising chest, ≥1 rolling machine for flat pieces of gh, and a final rising chest with dough boards and a ing oven, form an automatic prodn. line for Arabian cakes. The dough boards have a flat surface and a rounding rim, to the height or which they are filled h bran. These are hung so as to pivot as they move on less chains following a zigzag path through the rising est.

Used for the prodn. of Arabian flat cake bread from ugh which contains a large amt. of water and which uld be distorted from a round form if tipped from one t to another repeatedly during rising. The installation automatic, simple in design and needs very little main- ance, whilst the flat cakes produced are indistinguish- le from hand-made bread. 24. 11. 77 as 752464 (24pp1045)

B- ★ D11 42551B/23 ★DT 2752-621

iversal adjustment for mixer paddle arm - by U-bracket with dle and elongated holes

LIEBHERR-MISCHTECHN 25.11.77-DT-752621
J02 *(31.05.79) A21c-01/14 B01f-07/04*

e attachment of a paddle to the shaft of an annular tray ixer allows for its easy adjustment in two planes plus an gular adjustment. The round shaft is clamped between U-bracket and a cradle and can be turned and/or lowered raised. In addition, the U-bracket shell has elongated oles so that it can be readjusted (with the cradle) angula- ly.

This facilitates all adjustments during assembly or for ear. 25. 11. 77 as 752621 (6pp39)

TIPE- ★ D11 42644B/23 ★DT 2847-963

Convection type baking oven - with heat accumulator and water sprays for fast water vapour generation

TIPE REVENT AB 29.11.77-SW-013504
(31.05.79) A21b-01/26

A convection-type of oven for bakeries includes a heat accumulator in the circuit for the hot air. The heat accumulator consists of Vee shelves with metal balls which are arranged in a vertical plane and are made of a metal of high thermal conductivity. They are arranged at right angles to the air flow and are fitted with water sprays.

This is capable of evaporating very quickly large quantities of water. It requires no extra heat supply facilities like auxiliary heaters. 4. 11. 78 as 847963 (14pp39)

TANA ★ D11 43119B/23 ★J5 4052-741

Oxidising agent used in bread mfr. - comprises cysteine or its salt and L-ascorbic acid, part of which is coated with a low-melting solid

TANABE PHARMACEUTICAL KK 30.09.77-JA-118320
(25.04.79) A21d-02/16

The oxidising agent is prepd. by combining (a) 1 pt. wt. of L-ascorbic acid, (b) 0.4-1 pt. wt. of cysteine or its salt and (c) 0.4-1 pt. wt. of L-ascorbic acid coated with a coating agent which is solid at normal temp. and melts at ca. 40 °C.

As the coating agent animal or vegetable hardened oil such as tallow hardened oil, palm hardened oil, soy bean hardened oil, etc. and solid emulsifier of food use such as glycerin fatty acid ester, can be used. The oxidising agent is combined in flour so that L-ascorbic acid is 5-20 (5-10) ppm on flour.

L-Ascorbic acid is rapid and effective and its oxidising activity is not durable. When a part of L-ascorbic acid is previously coated with the coating agent, the oxidising activity of L-ascorbic acid can be exhibited throughout the bread mfg. process. The bread is as good as that prepd. with potassium bromate. 30. 9. 77 as 118320 (5pp5)

UVEN= ★ D11 43474B/23 ★SU -618-082

Dough mix preparation - involves using part of water for flour spraying and remainder for additives dissolution, and plasticising in vacuum

UKR VENDING EQUIP 01.12.75-SU-194254
(24.06.78) A21d-08/02

Improved dough and shorter period of its mixing are achieved by spraying flour and water contg. dissolved components conforming to the recipe. The dough mass is plasticised. The water used is separated into 2 parts 0.28-0.35 pts. wt. of water (on wt. of flour) and the flour is sprayed in the first stage. The components are added to the remaining water for spraying in the second stage. The plasticising process is carried out under vacuum.

The active centres of protein and starch interact with water to form hydrate shells. The components added to water include yeast, salt, fat, sugar and other items forming an emulsion which is adsorbed by the hydrated particles of flour.

Zolotov, E.B. Bul. 29/5.8.78. 1.12.75 as 194254 (2pp89)

LERE= ★ D11 43483B/23 ★SU -618-091

Prodn. of paste for cheese-cake mfr. - includes addn. of dried milk to fatty curds, sugar, butter cream and filler to improved storage life

LENGD REFRIG IND 10.08.76-SU-394996
(03.07.78) A23c-23 A23g-09

Dried milk is added to curd cheese based mixt. for cheese cake mfr. to improve its food value and storage life.

The product contains (wt. %): fatty curds 52.0-57.2, granulated sugar 20.2-20.6, butter cream 8.1-11.0, dried milk 6.0-8.0. remainder - filler. e.g. nuts. etc.

Patkul, G.M., Bocharova, S.G. Bul. 29/5.8.78. 10.8.76 as 394996 (2pp835)

KRAM/ ★ D11 43828B/23 ★US 4155-656
Dough kneader with paddle rotated by motor - carried in lid attached to bowl by yielding couplings
KRAMER H 12.09.77-US-832534 (19.07.76-US-706752)
(22.05.79) B01f-07/16 B01f-15

Dough is kneaded in a bowl by a paddle which is rotated about a vertical axis. A motor is mounted on a lid of the bowl to rotate the paddle which is supported only by the motor.

The lid is attached to the bowl by lugs which are received in slotted couplings projecting from thebowl. This coupling allows limited vertical movement of the lid while the kneader is operating. Resultant movement of the motor causes the axis of rotation of the paddle to alter during operation.

The appts. is a domestic dough kneader. The yielding attachment of the lid enables resistance of the dough due to lumps to be overcome. 12. 9. 77 as 832534 C.i.p. 4049243 (cf. 703857/39)(8pp295)

BAKP D11 04672A/03 =US 415
Rotary biscuit blank shaping machine - includes stripper blade, at constant angle, accommodating variations in blank thickne performing compound motion
BAKER PERKINS LTD 01.07.76-GB-027512
*+R13 R26 (22.05.79) *DT2728-758 +A21c-11/04*

A rotary moulding machine for biscuit dough includes dough hopper leading to co-operating rolls, one havin embossed surface for feeding dough downwardly and th other having moulding recesses. A scraper blade pre dough onto the recesses and removes excess from the mainder of theroll surface, the blade being carried by pivoted mounting.

The mounting is vertically and horizontally adjustab to maintain a constant operating angle with the roll, ad justment being actuated in response to the wt. of the m ded dough pieces. The machine leads to a more unifor product. 30.6.77 as 811928 (6pp1379)

D12: MEAT; FISH PROCESSING

UNIC D12 11325V/07 =DS 2338-418
Compressed accordion pleated food casing - with continuous, adherent barrier-forming layer on one face
UNION CARBIDE CORP 01.08.72-US-276919
*A97 +Q31 Q34 (31.05.79) *BE-803-079 A22c-13 B65d-65/38*

A tube-forming casing of regenerated cellulose. which may contain a fibrous layer is contacted with an unbroken, sealing layer, which adheres strongly to the surface of the casing. The sealing layer is impervious to moisture and gas and has a measured stretch capacity of less than 4%.

The sealing layer may be applied to the inside of the tubing and may be of a vinylidene chloride copolymer. The casing has a moisture content of $\geqslant 10\%$. The casing is placed on a rod and pressed. 28. 7. 73 as 338418 (4pp068).

DORN- ★ D12 42497B/23 ★DS 2818-147
Band saw for meat and bones - with retractable holding plate for large pieces
MASCHINENFAB DORNHA 26.04.78-DT-818147
(31.05.79) A22b-05

Band saw appliance for slicing of meat and bones includes a holding plate on a guide rod which is axially movable in a hinged bracket. By pushing back the plate against the bracket and swivelling it, the plate forms a flush extension of the worktable for extra large pieces of meat.

Appts. is suitable for even the largest pieces of meat which can be secured by hand until the plate can be swivelled back. 26.4.78 as 818147 (5pp39).

NMHB ★ D12 42501B/23 ★DS 2839-322
Fish gutting machine - with spring-loaded retainer for automatic adjustment to fish size
NORDISCH MASCH R BAADER 09.09.78-DT-839322
(31.05.79) A22c-25/14

Appts. for the topping and degutting of fish has two cutter blades, one oscillating, which perform a cut both sides of the spine directly behind the supraclavicula. A rail retains the fish rump, leaving a gap but offering enough resistance for the head extracting the gullet and innards from the rump.

Appts. permits the processing of fish of any size from sardines to herrings, mackerals and trout to be processed. The fish is securely retained during the gut extn. 9. 9. 78 as 839322 (4pp39).

KURE ★ D12 42594B/23 ★DT 2752-985
Removing malodorous basic components from gases - by contact with a support carrying an acid and or a salt
KUREHA KAGAKU KOGYO 28.11.77-DT-752985
E35 (31.05.79) B01d-53/14

The gas is contacted with a material which has been prepared by application onto a porous and heat-stable carrier $\geqslant 1$ cpd. which is a proton acid and/or $\geqslant 1$ Lewis acid and/or an acid salt, in amt. of 1-50%, calc. on the wt. the carrier.

The proton acid is phosphoric acid, boric acid, their mixt. or condensate, vanadic acid, chromic acid, an ar sulphonic acid esp. benzene sulphonic acid or terephtha acid. The Lewis acid is Ni sulphate, V sulphate, Mn p -phate or their mixt. The acid salt comprises the reac product of the above acids and a normal-shelling basic component such as NH_3, methylamine, ethylamine and/ pyridine.

Used for the treatment of effluent gases from e.g. fi factories; also for removing NH_3 from effluent gases wh have been treated with NH_3 to remove NO_x by reduction. 28. 11. 77 as 752985 (29pp004)

JACC/ ★ D12 42673B/23 ★DT 2850-
Meat tenderising tool - with spring loaded handle carrying sets narrow pointed stiletto blades
JACCARD A R 22.11.77-US-853840
P28 (31.05.79) A22c-09 A47j-43/28

A meat tenderising tool consists of a springloaded handl from which protrude several parallel sets of pointed narrow blades. They are guided in slots of a base plate which is placed on top of the meat to be tenderised.

This is a simple tool which is easy to handle and acce sible for cleaning. It is very effective in making tough pieces of meat easier to cut and easier to chew. 22. 11. as 850623 (13pp39)

EXTR- D12 55465A/31 =GB 1547-
Chopped fish compsns. - of improved storage stability when froz contain gelatin hydrolysate
EXTRACO AB 26.01.77-SW-000821
*(06.06.79) *DT2803-417 A23b-04/14*

Fish mince contg. gelatin hydrolysate is produced capable of improved stability during frozen storage. Amt. of gelatin hydrolysate is 3-6 wt. % w. r. t. fish mince, an is derived from gelatin or collagen which has been degraded to such an extent that it has lost its gel forming properties.

Pref. fish mince is whole fish mince, where the fish is cod and/or haddock. Pref. gelatin hydrolysate is incorporated into the mince in preparing the prod.

Used esp. in producing fish balls or fish sausages. Prod. can be stored in a frozen state for longer periods of time without protein changes. 24. 1. 76 as 002890 (3pp 931)

CIBA D12 20955W/13 =SU -618-020
Disinfection and sterilisation of seafood - using iodine complexed
with polyvinyl pyrrolidone
CIBA GEIGY AG 14.09.73-CH-013271
*A97 +P14 P34 (A14) (06.07.78) *BE-819-921 A23b-04/14*
Compsns. contg. iodine complexed with polyvinylpyrroli-
done (PVP) are used to disinfect and sterilise crustaceans,
fish and esp. edible shellfish. The compsns. pref. also
contain a cpd. liberating iodide ions, esp. HI, KI or NaI,
the wt. ratio of PVP:I_2 being 3-10:1 and that of iodide:I_2 a
being 2:1. The compsn. pref. has a (water/heptane) part-
ition coefficient (P), in aq. soln. corresponding to 1%
available iodine, of > 200 (where P is defined as $P = \frac{[Ia]}{[In]}$
where [Ia] is the conc. of iodine in mg/ml. aq. phase and
[In] is the concn. of iodine in mg/ml. of heptane phase).
Treatment is rapid and does not have the disadvantages
of taste and odour associated with Cl_2 treatment, antibiot-
ics are not used so the risk of increasing the number of re
-sistant microorganisms is reduced; treatment is appli-
cable to the living animals if necessary.

AZOV= ★ D12 43475B/23 ★SU -618-083
Fish scales and water separator - has perforated cylindrical section with curved deflector bounding discharge slot
AZOV BLACK SEA FISH 17.04.76-SU-348752
P41 (26.06.78) A22c-25/02 B04c-05/10

Lower losses of fish scale and improved sepn. of impurities are ensured by perforations of cylinder which holds a deflector. The latter is curved to form a slot type clearance guiding the scales into the conical section. The vessel is enclosed in a casing with a tube for draining the liq.

The degree of dewatering of the mixture is adjusted by altering the slot size, the catch passing the fish separator, leave scales and water in the strainer. The main part of water from the latter is discharged overboard, while the dense residue of scale suspension is pumped into the vessel for separation.

KIFO= ★ D12 43511B/23 ★SU -618-138
Centrifugal separator of fat from meat refuse - contains additional swinging container for receiving residual fat from drum before discharge of defatted product
KIEV FOOD IND TECHN 25.10.76-SU-415082
P41 (27.06.78) B04b-03

Centrifugal separator for defatting meat refuse, designed for production of fodder meal, and claimed in Parent certificate 178434, is improved by the provision of additional swinging container which collects residual fat remaining in the drum of the centrifuge, before the defatted product is discharged, thus preventing its mixing with residual fat, whose usual amount (about 10%) remaining in the drum reduces the quality of the fodder meal produced from meat refuse if mixed with it.

The additional container is mounted on the shaft in brackets at the side of the centrifuge and is swung manually by a handle, while the gate plate closing the outlet of the container is automatically opened and closed by tie rod activated by a face cam.
Tulchevskii, M.G. Bul. 29/5.8.78. 25.10.76 as 415082

MEYN/ D12 34990A/20 =US 4155-146
Extractor for cloaca of poultry - has accurately aligned, knife-centering pin preventing damage to carcass or entrails
MEYN P 24.01.77-NL-000677 (12.01.77-NL-000233)
*(22.05.79) *BE-862-059 A22c-21*

A vent-cutting machine for poultry includes a cutter in the form of a centre pin for insertion into the vent opening and a hollow cylindrical knife rotatable about the pin. The knife is arranged, e.g. by connection to a hollow shaft co-axial with the pin, such that on rotation of the cutter, it moves from a position in which the pin protrudes from the knife to one where the pin lies wholly within the knife.

The machine removes the vent without damage to the viscera, whilst making only a small hole. 23.12.77 as

Fish head and gut removal - by clamping on conveyor and passing circular saw and gut removing claw
YASHIMA KOGYO KK 10.08.76-JA-U06050 (05.08.76-JA-092824)
(22.05.79) A22c-25/14

A fish processing system includes a conveyor with regular

-ly spaced clamps which receive fish and carry them transversely through an appts. Above the upper run of the conveyor is a head removal station where a rotary saw partially cuts through the body and the head is then pushed off by an arm.

At a gut removal station on the lower run of the conveyor a rod is inserted into the body cavity. At the distal end of the rod is an articulated claw which is moved along the cavity wall to remove the guts.

The appts. removes the head and guts of fish, wall eye pollack used in mfg. boiled fish paste. 4.8.77 as 821979 (+5.8.76(3)-JA-092825;UO3980-1)(12pp295)

Proteinaceous fibres having meat-like consistency - formed by extrusion of a proteinaceous, micellar mass into a neutral coagulation medium above 90 degrees
GENERAL FOODS CORP 03.02.78-CA-296430
C03 (D12) (29.05.79) A23j A23p

Prodn. of proteinaceous fibres comprises injection of a proteinaceous, micellar mass, through a series of openings into an essentially neutral coagulation fluid medium at≥90°C and form proteinaceous fibres by coagulation.

Proteinaceous fibres are rubbery and elastic when they are hydrated; they may be dehydrated without loss of their structural integrity and may be easily rehydrated to give the rubbery and elastic form; they often carry fibrils; they are able to withstand elevated temps and pressure characteristic of sterilisationoperations; they retain their structural integrity on cooking and may be preserved in a frozen form for long periods without loss of their properties when they are unfrozen.

The fibres are used to replace natural protein in human and domestic animal foods. The fibres have the characteristics of meat fibres and may be used as meat substitutes in products homologous to meat, bacon, sausages, marine animal flesh (prawns, shrimp etc.), chicken in sauce etc. The product may be used to replace all natural protein fibre or as an extender to the natural protein. 1.2.79 as 873878 (13pp395)

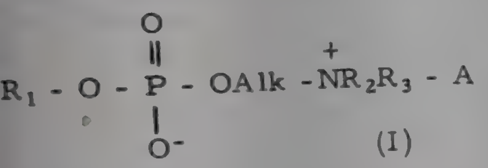
mmonio-alkyl phospholipid analogues - useful for modifying cell
ll properties e.g. for plant hybrid prodn.
MAX PLANCK GES WISSENSCH 24.11.77-DT-752553
B05 C01 E11 (D25) (31.05.79) C07f-09/09 C12k-09

hospholipid analogues of formula (I) are new.



$$R_1-O-\overset{\overset{\displaystyle O}{\|}}{\underset{\underset{\displaystyle O^-}{|}}{P}}-OAlk-\overset{+}{N}R_2R_3-A$$

(I)

In (I), Alk is 2-12C linear, branched or cyclic alkyl; A is NH_2 or $\{CH_2-(CH_2)_xNR_4R_5\}_yR_6$. R_1 is the residue of a mono- or polyvalent ali-
hatic primary or sec. alcohol in which any additional OH
re esterified or etherified, the ester and ether gps. being
f 1-26C opt. with ⩾1 C multiple bond. R_1 has altogether
⩾6C; R_2, R_4 and R_6 are each H or 1-4C alkyl; R_3 and R_5
re each H, 1-4C alkyl or free electron pair; and x and y
re each 1-5. (I) are made from R_1OH by sequential re-
action with $POCl_3$, HO Alk. Hal and NR_2R_3-A.

(I) modify the properties of cell membranes so are use-
ful for inducing fusion of cells to form plant hybrids; as
transport vesicles for pharmaceuticals and for modifying
cell-wall receptor sites which are responsive to hormones.
They also have immuno stimulating activity and, since they
are good, biodegradeable emulsifier can be incorporated
in foods, detergents, etc. 24.11.77 as 752553 (19pp1251)

Animal feedstuffs contg. antibiotic and proteolytic enzyme -
increase feed utilisation and rate of weight gain
HENKEL KG AUF AKTIEN 30.11.77-DT-753309
B05 C03 (D16) (31.05.79) A23k-01/17

An animal feedstuff based on carbohydrates, proteins, fats
and opt. other additives, comprises more than 20-150
ppm of one of the antibiotics Virginiamycin, Zinc-Bacit-
racin, or Flavophospholipol and an amt. of proteolytic
enzyme such that an enzymatic activity of 0.05-2.5 mTU/g
results.

The animal puts on considerably more weight when
standard feedstuffs are mixed with one of these antibiotics
and a proteolytic enzyme. The feedstuff is esp. suitable
as a starter for piglets and for piglets as they mature.
The feedstuff is also suitable where the use of the partic-
ular antibiotics is already known to be of advantage, e.g.
in feed for laying hens for fattening up pigs and raising
calves. Feed utilisation can increase by ⩽4%. 30.11.77

Sweetener for food and drinks - contains lactose and smal
quantities of ammonium glycyrrhizic acid, saccharin and
nucleotide
MACANDREWS & FORBES 25.11.77-US-854605
B05 E19 (31.05.79) A23l-01/23

Sweetener for food and drinks, etc., e.g. toothpaste,
consists, by wt., of 80-95 (85-95)% lactose, 0.5-12.5 (0.
-10)% ammoniated glycyrrhizic acid, 2-8 (5)% saccharin
and 0.025-0.075 (0.05)% of a 5'-nucleotide.

The sweetener compsn. is low in calories, has no bitte
after-taste and has twice the sweetening power of sacchar
alone. The compsn. combines the solubility of lactose wi
the sweetening power of ammoniated glycyrrhizic acid an
saccharin without the licorice taste of the glycerrhizic ac
deriv. and the bitter after-taste of saccharin.

The ammoniated glycerrhizic acid may be the mono-,
di- and/or tri-ammoniated deriv. The 5'-nucleotide may
be a mixt. of double N-contg. salts of 5'-inosinic- and 5'
guanylic acid. 25.11.78 as 851055 (10pp200)

MACA- ★ D13 42700B/23 ★DT 2851-08
Low calorie food sweetener compsn. - contains lactose and/
sorbitol, cream of tartar, ammonium glycyrrhizin and a nucleotide
MACANDREWS & FORBES 25.11.77-US-854604
B05 E19 (31.05.79) A23l-01/23 A23l-02/26

Sweetener for food and drinks consists, by wt., of 85-95
(89.5)% lactose and/or sorbitol, 2.5-7.5 (5)% K di-tart-
rate (cream of tartar), 2.5-7.5 (5)% ammonium glycyrr-
hizin and 0.025-0.075 (0.05)% of a 5'-nucelotide.

The compsn. is low in calories, neutral in taste, caus
no side-effects and combines the water-solubility of lacto
or sorbitol and the sweetening properties of ammonium
glycyrrhizin without its licorice taste. The compsn. re-
places sugar in cakes and confectionery. 25.11.78 as
851082 (10pp200)

ANVR ★ D13 42732B/23 ★FR 2401-6
Freeze concn. of aq. solns. and suspensions e.g. fruit juice - for fa
processing of prod. becoming highly viscous at low temp.
AGENCE NAT VALORISATION 30.08.77-FR-026374
J01 (D16) (04.04.79) A23l-02/12 B01d-09/04

The soln. is frozen and spread into a layer of 0.1-3 mm
thickness. This layer is broken up into flakes which are
then processed through a number of repetitive cycles of
prod. compression followed by decompression. In each
cycle the pressures exerted on the prod. during the com-
pression and decompression stages are equal to or great
pressures of the preceding cycle.

As a result, the process delivers an enriched aq. soln. or concentrate and pure, compressed ice.

The repetitive, processing cycles are pref. carried out in a multi-stage screw press. Each stage of the screw press rotor has a length of helical scroll followed by a length of plain shaft where decompression follows compression by the scroll. The characteristics of each length of helical scroll are selected to provide the desired compression.

Used in prodn. of concentrates of fruit juice, beer, wines, blood plasma, whey, enzyme extracts, herb extracts etc.

Process allows the quality-retaining characteristics of freeze concn. to be applied to prods. where high viscosity at low temp. had impeded crystal growth. The installation is simple, robust and inexpensive. The time taken to produce the concentrate is greatly reduce compared with earlier processes e.g. down to about 10%. 30.8.77 as 026374 (18pp448)

Cheese powder prepn. from skim soln. - by inoculation fermentation heating coagulate separation fat addn. and drying (NL110176)

SOC PROD NESTLE SA 09.07.75-CH-008938 (09.06.76-US-694318)
*(22.05.79) *DT2541-102 A23c-19*

A cheese in powder form is produced, which after reconstitution with 40-60 wt.% of water, and heating to 50-80°C has the properties of heated mozzarella.

A colloidal soln. of a skimmed milk or reconstituted skimmed milk powder is inoculated with a lactic ferment contg. lactic acid producing Streptococcus bacteria. The soln. is allowed to ferment under aerobic conditions until the pH falls from 4.8 to 5.2. The ferment is then heated to 40-70°C under turbulent conditions to obtain curds and serum. The curds are sepd. from the serum, which are then mixed with 35-45 wt.% w.r.t. dry matter, of fats. pH of mixt. is maintained at 5.1-5.3 cooking salt is added, the mixt. homogenised and spray-dried to obtain powder form.

Prod. has a delicate milky taste, a creamy paste-like consistency and cohesion properties, and keeps well after reconstitution. 9.2.78 as 876511 (2pp931)

Bulgarian yoghourt ferments prepn - from micro-organism strains of St. Thermophilius and Lb Bulgaricum

DSO MLECHNA PROMISH 04.12.73-BG-025150
*(D16) (22.05.79) *BE-822-911 A23c-09/12*

Combination starters for the prodn. of Bulgarian sour milk are obtd. by inoculating each of a number of portions of sterile cow milk with a combination starter contg. micro-organisms strains selected from Lactobacillus bulgaricus Nos. 5,26,37 and 144 and another microorganism strain selected from Streptomyces thermophilus Nos. 12, 14, 18 and 22 to form a number of inoculums. The inoculums are cultivated at 44-46°C to cause coagulation, and coagulation times are observed.

Combination starters are selected which cause coagulation in $\sim$ 2 hrs. and have desired cellular configuration and ratio between the two strains. Sterile sheep milk or a 1:1 mixt. of sheep and cow milk portions are inoculated with $\sim$ 1% of selected starters to form inoculums. The inoculums are subcultured by daily innoculation in the sheep milk during first four months and weekly for two additional months.

Combination starters which maintain consistant cellular configuration and consistant desired ratio between the two strains throughout subculture are selected. The resulting combination starters are tested for producing Bulgarian sour milk. 25.4.77 as 790535 (+4.12.74, 27.9.76-US-529475, 727040)(7pp964)

Dry hydrosoluble foodstuff prodn - by mixing starch etc with friable mass of hydrophilic substance

CPC INTERNATIONAL INC 21.08.74-DT-439993
*(22.05.79) *BE-832-598 A23l-01/34*

A dry edible prod. is prepd. in the form of agglomerates having starch nuclei. Each nucleus is embedded in a layer of a hydrophilic substance.

A homogeneous, conditioned mass of hydrophilic substance, moisture and starch is prepd. by first mixing together to form a crumbly mass 3-30 wt.% of $\geq$ 1 hydrophilic substance with water or aq. lia. Then 25-75 wt.% of starch (-contg. material) is folded into the crumbly mass to obtain a homogeneous mass. The mass obtd. is conditioned at ambient temp. with agitation for $\geq$ 20 mins. The mass is dried to a moisture content of 2-10%. The dry prod. is sifted to particle size of 100-300 microns.

Discrete particles contg. nuclei of starch (-contg. material) with each nucleus embedded in a layer of hydrophilic substance are formed. Hydrophilic substance is a sugar, sugar alcohol, inorganic salt, sodium glutamate or their mixts. Used in blending with dry food ingredients to form an instant food prod. capable of being easily dissolved
lumps. 14.7.77 as 815757

Appts. for continuously sepg. fruit flesh and juice - rotates vanes and enclosing conical sieve at different speeds
WESTFALIA SEPARATOR AG 19.09.75-CH-012216
P43 (15.05.79) A23n-04/22 B07b-01/26

Fruits, esp. grapes, are processed in a machine in the housing of which there is a rotor with radial vanes enclosed by a sieve which also rotates on the axis of rotation, at a circumferential speed different from that of the rotor. In the radial projection to the axis of rotation, the faces of the vanes subtend an acute angle to this axis, and the sieve and the rotor are conical in shape.

At its narrow end the sieve has a filling inlet, and an adjusting mechanism is provided to vary the distance between the inner surface of the sieve and the rotor vanes, which makes possible a relative axial motion between sieve and rotor.

Used for the continuous sepn. of the flesh and juice of fruits from the kernels, esp. of the flesh and juice of grapes from the seeds and skin. The arrangement makes it possible to separate the seeds completely so that their oil can be recovered, whilst the quality of the mash for fermentation is improved. 19.9.75 as 012216 (6pp1014)

Ring mould press for fodder pellets - with steam admixture to conditioner controlled by press motor current (BE 30.5.79)
NORVIDAN ENG APS 30.11.77-DK-005299
P71 +P41 (31.05.79) A23k-01/20 A23n B02c B30b-11/22

A pellet press for ground animal feeding stuff is controlled by raising the amount of steam introduced in a mixer preceding the press until the load current of the press drive motor begins to rise. It is then reduced until the current has reached a minimum and is retained at that level until any change in feed results in a motor current rise. The steam admixture rate is then readjusted.

This requires only one control system to keep the motor current to a minimum. Such an automatic control increases the efficiency of the press and ensures the best utilisation of the press capacity. 24.11.78 as 850910(11pp39)

E35 K07 Q73 (E16) (30.05.79) F23g G21f

The treatment of waste solns. contg. ammonium nitrate and possibly urea, originating from the prodn. of combustible and/or fertile materials for nuclear reactors, involves injecting the relatively conc. soln. as a fine spray, into a zone of thermal decompsn. of ammonium nitrate. The decompsn prods. are sepd. by condensn. into a liq. phase and a gaseous phase.

In this process, the waste soln. is first concd. in a thin film evaporator equipped with a vacuum pump. The concentrate then passes through a filtration apparatus and is fed into a cooled storage reservoir, from which it is introduced into a heated decompsn. tube. The decompsn. prods. pass through a condenser, and the condensate is collected in a reservoir.

The process can be carried out continuously, and allows relatively conc. solns. to be treated without risk of explosion. 30.11.78 as 872416 (21pp1319)

Control of deposition in steam generating system - by addn. of non-sulphonated, carboxylated lignin deriv. to system water

BETZ LABS INC 15.05.75-US-577586

A97 F09 (15.05.79) C11d-07/22

Deposition in steam generating systems is controlled by adding 1-500 (10-50) ppm of a non-sulphonated, carboxylated lignin deriv. (I) to the H_2O of the steam generating equipment. (I) has little tendency to oxidise under oxidn. conditions, a mol. wt. of 1000-125000 and an Alpha range of 5-50. Pref. (I) have Alpha range 10-40, and are derived from a Kraft pine lignin.

Use of (I) controls the deposition of various muds, silts and debris and the formation of scale in the metallic structures of steam generating equipment so that systems may be operated economically and continually. 12.12.75 as 241634 (18pp478)

Coal-base landfill leachate treatment for contaminant removal - from ground-water, using adsorptive curtain wall of coal to intercept refuse leachate

JONES C T 19.03.76-CA-248327

Q35 (15.05.79) B65g-03/02 C02c-01/02

Landfill leachates are treated within a prepared landfill site comprising a drained impervious base which is overlaid with an impervious liner and covered by layers of adsorbent C. A plurality of interconnected perforated flexible pipes are laid within the C to gather and conduct the leachate to collecting sump wells which extend vertically to the surface of the landfill. Refuse is placed on the C and leachate passes through the refuse to the pipes to the wells for pumping to sepn. beds, biological treatment beds and tertiary treatment beds.

Used for recovering and treating leachates from landfill operations utilising coal base. Leachates issuing from both controlled and uncontrolled landfill operations can be treated. Heavy metals, BOD, COD are removed in great quantities from the leachates. The adsorptive contain wall of C surrounding old landfill operations intercepts the horizontal flow of leachate. Offensive odours can also be removed along with harmful bacteria, pathogens and viruses to prevent them from passing into ground waters. 19.3.76 as 248327 (32pp1044)

Mixing waste acidic and alkaline solns. - with outlet for alkali soln. in centre of passage for acidic soln.
JAPAN ORGANO KK (NIHA) 13.07.77-JA-082887
E33 (26.03.79) C02c-05/02

In a process for mixing waste acidic soln. (I) contg. alka ine earth metal ions, i.e. Ca or Mg ions, with waste all aline soln. (II) contg. (bi)carbonate or silicate ions to ef ect neutralisation, the improvement comprises opening a jet type outlet for (II) in the centre of a passage for (I) in the direction of flow soln., thereby surrounding the flow (II) with the flow of (I). The total flow is passed through narrow passage to effect rapid mixing, thereby adjusting the pH of the resulting mixed soln. to 4-6. The adjusted soln. is stripped with air in a stripping tower to remove free CO_2.

Both waste solns. (I) and (II) are thus neutralised with out causing pptn. of $CaCO_3$ and Ca silicate. 13. 7. 77 as 082887 (7pp51)

Continuous redn. of hexa-valent chromium - using ferrous ion specified pH, giving a ppte. of tri:valent chromium hydroxide
FUJI KASUI KOGYO KK 03.10.77-JA-117951
E31 (24.04.79) C02c-05/02

Hexavalent chromium (I) is continuously reduced with fer rous ion (II), which is fed into a soln. (III) contg. (I). The pH of (III) should be adjusted to 4.8-8.5, (5.5-7.2) and the flow rate of (II) should be controlled so that oxidation-redn. potential in the system is adjusted to -50 to -150 mV, (-50 to -100mV). The inventors had developed the method, in that (I) is treated by (II). However, in this method, a large excess of (II) must be used for complte redn. of (I).

In the present method, (I)can be reduced completely by a theoretical amt. of (II), instead of using a large excess of (II). (I) is reduced to 3-valent chromium and then precipitates as chromium hydroxide. 3.10.77 as 117951 (3pp42)

esalination of sea water - by filtration through a filter or screen
nd a tubular semipermeable membrane
KOBE STEEL KK 01.10.77-JA-118367
J01 (24.04.79) B01d-13 B01d-31

ea water (I) is converted to fresh water (II) by (1) filtrat- on of (I) through a filter or screen of mesh 20-300 µ and 2) filtration of (I) through a tubular semi-permeable mem- rane (III).

The pretreatment of (I) before the filtration is simpli- ied. High purity (II) can be recovered without increase in running costs. As the pretreatment of (I) can be carried out rapidly, the life-time of (III) can be prolonged even if t is used for high temp. (I). Clogging of (III) with solid particles is reduced.

The pH of (I) is adjusted to 5-6.7 before step (1). (II) obtd. by the step (2) may be filtered through a spiral or hollow fibre semi-permeable membrane. The surface of (III) can be washed with elastic material and solid particles accumulated on it can be easily removed. In step (2) having $\geqslant$ 2 stage of (III), the concentrate in the first half-stage is discarded to the sea, the filtrate in the first half stage is filtered through (III) in the latter half stage, and the concentrate in the latter half stage is mixed with raw sea water and treated in the first half stage. 1.10.77 as 118367 (5pp42)

A sludge is effectively concentrated by electrolysis in an electrolysing vessel in which cathodes and anodes are arranged alternatively, A voltage of 30-60 volts is applied such that a current of 100-1,000 A/m³ flows between each pair of electrodes to effect electrophoresis to the sludge and destroy the electric double layer generated on the interface between the sludge and water, and further to generate Joule's heat on the water sepd. from the sludge so as to accelerate rapidly the coagulation and the sedimentation of the sludge. 19.3.76 as 029351 C02c-5/12 (16.5.79) KAKIHARA M(3pp34)(J52113548)

phenol and organic cpds. removal from aq. waste soln. - by treatment with methanol and sulphuric acid, irradiation and sepn. of precipitate

PHYSICAL CHEM RES 25.01.72-SU-741031

E14 K08 (10.01.79) B01j-01/10 C02c-05/02

Waste contg. phenols or substances such as benzene, dipyridine and furan is mixed with methanol and an acid and treated with γ-radiation or accelerated electrons, followed by sepn. of the ppte. The efficiency of the oxidn. can be increased and the dose of radiation required can be reduced if the acid used is a mineral acid such as sulphuric acid

The optimum ratio of methanol to sulphuric acid is 1:2 mol./l. per mol. phenols. Using both additives, a dose of only 2 Mrad. is required, while use of methanol alone requires 20 Mrad; use of sulphuric acid alone requires 10 Mrad. The absence of additives results in a dose of even 20 Mrad being ineffective.

Bulk filter for water purification - contains ultrasonic emitter and ramp in filtration chamber separated from inlet and collection tanks by partitions with bottom openings

MOSC GEOLOG SURVEY 06.08.76-SU-392761

(26.06.78) B01d-23/10 C02b-01

Increased efficiency of the process of purifying potable or effluent water for towns, settlements or industrial estates, and improved quality of water produced by capillary filtration in the bulk filter filled with sand (or other filtering material), are ensured by enhancement of the capillary lift of water flow by application of ultrasonic vibrations.

Thus, the filtering chamber mounted between inlet and collection tanks, and separated from them by partitions having opening at the bottom, contains ramp plate of the same height as the level of the raw water in the inlet tank. Between the ramp plate and the partition separating the filtering chamber from the inlet tank, an ultrasonic emitter is mounted.

Washing, sorting, cleaning and cutting machine for mushrooms automatically trims soiled stalks and cuts them to length

TEIMEX AG 30.06.76-CH-008398

(15.05.79) A23n-15

A machine for cleaning and grading mushrooms automatically comprises a first trough contg. water into which a charge of mushrooms is deposited. A flow set up in the water by a pump transfers them to a second trough from which they are lifted by a conveyor into a sorting mechanism. From the sorter they fall, the smallest first and the larger following, according to the size of their heads onto chutes and thence between profiled guides with endless wires.

There they are aligned with their stalks downwards wit the help of jets of water which complete the washing and are moved towards first and second cutters formed by ba saws where the soiled tips are cut off first and the stalks are then cut to length.

Replaces the intensive manual work necessary previously and which does not in any case guarantee perfect cleanliness and quality. As well as cutting off the bottom of the stalk, the machine makes it possible to grade the mushrooms on the basis of the size of their heads. 30.6. as 610734 (7pp1014)

Biogum of improved dispersibility is recovered from an aq. medium by heating the aq. medium contg. the dissolved biogum, and having pH $\leqslant$ 7, to 70-100°C for sufficient time to improve dispersibility of the recovered biogum.

Heating takes place in the presence of 0.5-15 wt. % of a dialdehyde w.r.t. dry wt. of biogum. Dissolved biogum is then recovered from the medium. Pref. the aq. medium is a fermentation beer. The heating time is 2-5 mins. Biogum is xanthan gum, 5-7 or 5-10 gum. Dialdehyde is glyoxyal.

Used esp. to recover xanthan gum from pasteurised beer. Xanthan gum is pptd. by adding isopropyl alcohol, dried and milled. 16. 11. 77 as 047708 (4pp931)

(I)

In the title process cpds. (I) (where X is CO, CS, or O. R is H or 1-8C hydrocarbyl, and R_1 is a residue derived from an amino acid by removal of $-CH(NH_2)COOH$) are hydrolysed in the presence of an enzyme. The desired isomer is isolated and the undesired isomer is racemised by heat and adjustment of pH to give further quantities of (I) which are recycled.

The desired carbamyl amino acids are converted into the corresp. amino acids. Thus, 5-isopropylhydantoin is converted into 1-carbamoylvaline using dihydropyrimidinase from calf liver, the di-isomer being racemised and recycled 1-valine is prepd. by hydrolysis of the carbamyl deriv.

Vertebra degenerative dystrophy treatment - involves vertebra traction and reduction followed by stabilisation and papain injection
KHARK ORTHOPEDICS 10.01.77-SU-441871
B04 P31 (23.06.78) A61b-17 A61k-29

Efficient treatment of degenerative distrophy of vertebra and faster ankylosis are achieved by traction and reduction of vertebra followed by stabilisation of the affected segment with a clamp. Then papain is injected into the intervertebral discs to saturate them.

The puncture of the affected discs is carried out after general anaesthesia and the syringe needle is inserted laterally. The capacity of the discs is determined by discography, and access is made to the spinous processes and to base of arches.

The papain soln. contains 5 mg. of solid substance and 1 ml. of solvent. Then 5-10 min. after the first injection a second injection is made using 96% ethanol. Desensitising theraphy in the post-operative period prevents allergy complications.

Turbo-ejector for aerating and stirring culture media - contains perforated rings mounted between disc of fan and profiled casing of rotor

BIOTECH RES INST (SVET=) 17.01.77-SU-445162

(26.06.78) B01b-05/16 C12b-01/16

Simplified design of the turboejector for aerating and stirring culture media, as used in microbiological ind. for growing microorganisms, e.g. yeast, is ensured by introduction of perforated rings mounted between the discs of the fan and the curved walls of the rotor.

The initial liquid is taken by the vanes of the propeller pump and ejected through the perforated rings in a multitude of thin streams. These aspirate the air stream freely incoming from the fan, and form air-liquid mix which then is fragmented by a row of inclined baffle plates fixed inside the nozzle, before it is ejected from the turbo-ejector.

Inoculum culture preparation - divides sterilised nutrient with one stream for bacterial growth and the other held for mixing

FERMENT PRODUCT RES 13.01.77-SU-442668

(03.07.78) C12b-01/08 C12c-11/08

Infection of medium is prevented and inoculum growth is intensified by dividing the cooled sterilised nutrient into two streams. One stream is used to grow the bacterial culture for ferment production for hydrolysing the starch of the medium. The time of growth takes 16-18 hr., and during that period the other stream is held up.

This is followed by mixing and subsequent sterilisation as well as cooling before starting the growth of inoculum on the hydrolysed nutrient. The improved assimilation of the nutrient increases the concentration of solids and reduces the growth period.

Yarovenko, V.L., Belozerov, P.A., Yarovenko, V.V. et al. Bul. 29/5.8.78. 13.1.77 as 442668 (3pp89)

ultivating bacterial strain in presence of hydrous metal oxide and
helated poly:hydroxy support
GIST-BROCADES NV 20.02.76-GB-006841
*(22.05.79) *GB1514-425 C12b-01/20 C12j-01/04 +C12d-01/02*

ermentation process comprises continuously cultivating
(non)extra-cellular cellulose producing bacterial strain
n a medium contg. the substrate, in the presence of ~
.01-2.2 g/l hydrous oxide of Ti, V, Zr, Fe or Sn, chel-
ted to a polyhydroxy support selected from cellulose,
wood, saw dust, glass, siliaceous materials and polymers
contg. C-OH or Si-OH.

When the strain is non-extracellular producing, the metal oxide polyhydroxy support chelate has a wt. ratio of polyhydroxy support of 1:2-1:25 (w/w), and is added to the medium. When the strain is extracellular producing, the chelate is formed in situ in the medium from the oxide and cellulose produced extracellularly by the strain.

The process is used e.g. for the prodn. of vinegar. 14.2.77 as 768486 (6pp924)

Liq. drinks clarification - such as vinegar and beer, by contacting them with a strongly acid cation exchange resin (NL250177)
SMEDLEY-HP FOODS 22.07.75-GB-030690
*A91 (22.05.79) *DT2632-116 C12h-01/04*

Haze precursors are removed from a fermented beverage such as raw vinegar from grape vine or malted barley and raw light beer, then maturing it.

The fermented beverage in raw state is filtered to remove solids. The filtrate is passed through a clarification tower contg. an ion-exchange resin material in hydrogen form contg. a gellular strongly acidic cation exchange resin of a sulphonated styrene-divinyl benzene copolymer having 8 wt.% divinylbenzene. The clarified beverage is then transferred without further resin treatment to a vessel and allowed to mature.

Method avoids the traditional requirement for large maturation vats provided with beechwood for purification. 5.8.77 as 822278 (+22.6.76-US-698600)(2pp931)

Improving stability and flavour of wine - by treating separate portions with anion and cation exchangers then blending
MOGEN DAVID WINE 24.07.78-US-927638
(22.05.79) C12h-01/04

Wine is treated by contacting separate portions with (a) a weak basic anion-exchange material, or (b) a strong acid cation exchange material. The treated wines are then blended (opt. together with untreated wines) in such proportions that theblend is stable and has better taste and flavour characteristics than the untreated wine. The method is esp. useful for wines with a strong foxy or wild characteristic, e.g. those from the species Vitis labrusca

Stabilisation (i.e. removal of tartrates) and quality improvement are achieved without the costs of refrigeration and without significantly increasing mineral content.

D/S: N(BR, SU, US) + E(CH, DT, FR, GB, LU, SW).

Method of dispersing light in a culture medium for cultivation of chlorella, or other algae, is given. Beams of light, e.g., sunlight, are led into a culture medium, e.g., in a tank, by a bundle of optical fibres, or similar light transmission means, which have light-receiving surfaces lying above the level of the culture medium an form branches below the level of and extending through the medium. Each branch defines light radiation surfaces, which, suitably, are larger than the light-receivin surfaces.

Dispersion of light in the medium is maintained even when direct penetration of light is prevented by growth of cultivated material. The efficiency of the cultivation of the algae is increased.

Semi-finished prosthetic dental preforms prodn. - by moulding repulverised porcelain contg. binder, then coating and baking

STERNDENT CORP 11.05.77-US-795930
A96 P64 (A18) (22.05.79) B28b-01/20 B29c-05/04

Semi-finished prosthetic dental preforms are made by first repulverising, by spray drying, a dental porcelain mixt. (A) which includes a binder-plasticiser (I) and lubricant. This material is then moulded to the required shape, and then a coating of incisal or occlusal dental porcelain applied to parts of the exterior surfaces.

The moulded prod. is then heated and baked to completely burn out the binder giving a hard concretious material. The binder is 14-18 wt.% of (A) and includes 10.5-8.5% EVA resin, 5.3-3.9% mineral seal oil and 2.2-1.6% stearic acid. Pref. the casting is removed from its mould by applying a pressurised fluid.

Used esp. for making prosthetic crowns. Method gives greater accuracy, esp. in mass prodn. 11.5.77 as 795930 (10pp1251)

Sodium dichloro isocyanurate dihydrate prepn - by heating anhydrous sodium dichloro isocyanurate with a hydrated salt
FMC CORP 18.07.73-US-380459
*E34 (31.05.79) *BE-817-721 C07d-251/36*

A mixt. contg. sodium dichloro-isocyanurate (I) with 11-14.1 wt. % hydrate of water and which is free-flowing and stable to storage and thermal decompsn. is prepd. Cpd. (I) with less than 11 wt. % hydrate water is mixed with a suitable amt. of a hydrated salt which releases its water of hydration at temps. between room temp. and 70°C. The mixt. is heated to release the water of hydration and maintained at this temp. The hydrated salt is pref. sodium sulphate decahydrate, sodium tetraborate decahydrate or sodium carbonate decahydrate. Cpd. (I) is useful in disinfectants and detergents. 29.6.74 as 431338 (3pp068).

*A97 G04 (31.05.79) *DT2529-096 C11d-01/72 C23g-05*

Articles with stains of fat or fatty materials, e.g. hydrocarbons or vegetable fats are cleaned with a cold-cleaning

more ethoxylated phenols contg. 3-6 molecules ethylene oxide and with 8-20C atoms in the alkyl chain and (b) one or more ethoxylated aliphatic alcohols or phenols contg. 7-18 molecules ethylene oxide and with 8-20C atoms in the alkyl chain. The molar ratio of component (a) to component (b) is 27:1 to 1:1. The emulsion may be used to clean oily metal articles. 30.6.75 as 529096 (4pp068).

KAOS ★ D25 42661B/23 ★DT 2850-256
Low viscosity aq. stable liq. cleansing compsn. - contains partly crosslinked polyacrylic acid, hydrotropic agent, nonionic surfactant, scouring agent and pH regulator
KAO SOAP KK 28.11.77-JA-143042
A97 E17 (A14 A25 E14) (31.05.79) C11d-03/37

Liq. cleansing compsn. consists, by wt. of (a) 0.1-0.6% partly crosslinked polyacrylic acid having average degree of polymerisation 10^3-10^5 (10^4) and Brookfield viscosity $\geq$100 (100-200) g/sec. cm.; (b) 1-10% hydrotropic agent; (c) 0.5-10 (1-5)% nonionic synthetic organic surfactant, (III), having HLB 10-17; balance (d) particles of $\geq$1 water-insol. scouring agent, water and sufficient water-soluble pH regulator to maintain the compsn. at pH 5-9.

The hydrotropic agent has formula ROH (I) (where R is 1-3C alkyl), or $R'-O-(R''O)_nH$ (II) (where R' is H, 1-4C alkyl, Ph or benzyl; and R'' is $-C_2H_4-$ and/or $-C_3H_6-$; and n is the average no. of added moles, provided n = 1 to 20 when R' is H and n = 1 to 3 when R' is a gp. other than H).

The compsns. have viscosity $<$5000 cps; resist prolonged storage at different temps.; are easily applied to surfaces and are retained well by a vertical surface. The water-soluble hydrotropic agents (I) and (II) increase dispersion stability. 20.11.78 as 850256 (23pp200)

Pourable, water dispersable conc. liq. fabric softener - comprising quaternary ammonium substantive and softening components
PROCTER & GAMBLE CO 06.07.77-GB-028300 (26.06.78-US-919204)
*E19 (22.05.79) *EP-----406 D06m-13/34*

A conc. liq. fabric softener is prepd. having improved pourability and water-dispersability characteristics and comprising 25-55 wt. % of an active system contg. a fabric-substantive agent and fabric-softening component.

Fabric-substantive agent is a polyamine, 10-24C alkyl-pyridinium salt or a mixt., such that agent has a water-solubility of > 5 wt. % at pH 2.5 at 20°C. Fabric-softening component is a quat. ammonium salt, alkylimidazolinium salt. 1-24C fatty ester of mono- or polyhydric alcohols, ethers of 10-24C fatty alcohols, fatty cpds. contg. S or N as a linking atom, or their mixts. wt. ratio of fabric substantive to fabric-softening cpds. are 6:1 to 1:4. Compsn. further contains a liq. carrier.

Compsn. is easily dispersible in aq. medium and can evenly deposit onto fibres to provide textile handling benefits inclusive of softening, static control, ease-of-ironing fluffiness, pliability and smoothness. 26.6.78 as 919204 (87pp931)

UNIL D25 55576V/31 =US 4155-871
Flowing cleaning compsn. contg. scouring bleaching agents - with particles of an alkaline buffer cpd. suspended together with other solids by means of a surfactant combination
LEVER BROTHERS CO 19.01.73-GB-002907
*(22.05.79) *DT2402-224 C11d-07/06*

A pourable liq. detergent compsn. comprises an aq. detergent soln. having a field stress value at 20°C of 1-21 dynes/cm^2 and a buffering amt. of solid particles of an alkaline buffer, having a solubility at 20°C of 0.0005-0.2 pts. wt./100 pts. wt. water and providing a pH of 10-13, dispersed in the soln.

Pref. the buffer is $Ca(OH)_2$ or $Mg(OH)_2$. 22.4.77 as 790162 (+16.1.74-US-433950)(3pp910)

BASIC NUMBER INDEX (V)

Weekly by section and overall, lists all entries by accession number. Each heading consists of the accession number in bold, followed by the CPI section letters. There then follows a list of all the family members, commencing with the basic and finishing with the current week's patent. For each family member the CPI week of issue is quoted, and a plus sign indicates that a multiple priority has been claimed.

MANUAL CODE INDEX IN Basic Abstracts Journal only

At the start of each main group of codes, the manual code and its descriptor are printed in the middle of the column. Each sub-division of a manual code group appearing during the week is given, accompanied by its descriptor. All manual codes occurring during the week within each sub-division are then listed, with accession numbers posted against them.

In all there are about 3,600 manual codes in CPI, each one having an average of less than 200 documents assigned to it per year. The full classification is set out in the Manual Code Instruction Manual, which also contains a keyword index of terms for easy reference.

APPENDIX I

COUNTRY COVERAGE

"Major" Countries

Covered completely in CPI and WPI from the commencement of the service except: Research Disclosure 1978, Europe and PCT 1979, Sweden transferred from "Minor Countries" 1979. Average weekly numbers are listed alongside.

Fast publishing

Belgium	180	
Europe	150	
France	740	
Germany, W. unexamined	1050	
Japan unexamined	845*	
Netherlands unexamined	240

United Kingdom examined	300	
United States	1200	4375

*Only CPI coverage for Japan.

"Minor" Countries

Complete coverage, but only introduced during 1975, with exception of Italy 1978.

Fast publishing

Brazil	140	
Denmark	120	
Finland	60	
Norway	80	
Portugal	30	430

Slow publishing

Austria	125	
Czechoslvakia	180	
Hungary	35	
Israel	40	
Italy	155	
Rumania	25	560

MINOR AND MAJOR COUNTRIES

If the first publication of an invention takes place in one of the 'major' countries listed above, then this publication is called the basic patent, a WPI accession number is assigned, and this is used for all subsequent members of the family.

If, however, the first publication occurs in one of the 'minor' countries listed above, then the document is regarded as a provisional basic. No accession number is assigned, since an abstract is not provided. If this provisional basic is then followed by further family members also from 'minor' countries, these produce entries in the same indexes even though an accession number has still not been assigned.

However, as soon as a member of the family is published in one of the 'major' countries, then this is regarded as the first disclosure. An accession number is assigned, and will apply also to all the earlier members of the family (from the 'minor' countries). Hence it is possible to see, in Index V, entries where the basic has a later week number than some of its equivalents.

For CPI, if the first publication occurs in Sweden, South Africa or Japan — in the case of Non-Japanese nationals — then the document is treated as a provisional basic as outlined above. Other than for Japan where a heading is given, an Alerting abstract is included in CPI at this stage.

Subsequently, when a documentation abstract is available an accession number is assigned to the document and the abstract published in the BAJ and related products. Headings will be included in the Alerting Bulletins for Sweden and South Africa together with abstracts for the Japanese at this later stage.

Entries are included in WPI Gazettes at both stages. At the later stage both a basic and an equivalent heading will be given for each such patent number.

COUNTRY CODES

For patent number (not priority) purposes, DS distinguishes accepted West German specifications (DAS) from the unexamined applications (OLS) which are given the normal DT code. in the case of Japan J5 represents the unexamined applications, and J7 the examined of the present series.

Arrangement of Abstracts

See Appendix I for definition of 'Major' and 'Minor' Countries.

'MAJOR' COUNTRIES – An alerting abstract of every basic and examined equivalent document is provided except for equivalents from Canada, East Germany and Switzerland. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

l mixer with rotary and planetary action agitator - partic. for gh to make loaf with increased baked vol. to wt. ratio
AKER PERKINS LTD 15.02.78-GB-006070 (15.02.78-GB-006039)
(29.05.79) A21c

e bowl has a vertical, cylindrical upper section surm-ting a coaxial, hemispherical base.

The mixing element can be driven to rotate simply out a vertical axis coinciding with the axis of the bowl. e elements can also be driven to rotate simultaneously out a second axis inclined to and intersetting the first, s providing the element with a planetary motion.

The mixing element is shaped to follow closely the mispherical surface of the bowl during rotation. For anetary motion mixing, the element is pref. rotated in posite directions about the two intersecting axes.

R/ ★ D11 44310B/24 ★DT 2852-525
ading carriage and shelf rack for baking oven - produces oven ttom bread with minimal energy and labour
LEBRUN C 05.12.77-FR-036545
(07.06.79) A21b-03/15

n arrangement for loading a baking oven includes at least e rack. This has shelves formed by full plates capable storing heat, and it remains inside the over chamber. loading and unloading trolley consists of a frame with heels and a number of flat supporting plates placed one bove the other so that they can be inserted between the helves of the rack. Each supporting plate carries an ndless runner of the type usual in bakery plants, on hich the portions of dough are placed for feeding on to the ven shelves.

This combines the advantages of baking trays put onto helves in the oven chamber and loading racks wheeled nto and withdrawn from the oven. There is no loss of heat nergy by the cooling down of the rack shelves outside the ven during changeover, labour is economised and maintenance costs are reduced. 5.12.78 as 852525 (15pp1045)

(23.05.79) A23g-09/20

Starting material for cookies and acid-treated gelatin are dispersed and carrageen is added to the dispersion. The product is frozen with agitation to give a partially frozen foamed material then this completely frozen. The product gives foamed cookies upon thawing. 25.5.71 as 035160 A23g 9/20 (23.5.79)MORINAGA MILK KK (3pp22) (J4 8001167)

KIFO= ★ D11 45216B/24 ★SU -619-162
Mesh hearth-conveyor for baking oven - has interwoven wire threaded with transverse rod like elements, with eyes to connect with traction chains
KIEV FOOD IND INST 03.12.76-SU-426435
(30.06.78) A21b-01/42

Mesh-hearth for a bread-baking oven, which also doubles as a conveyor for the loaves, is made up of spirally-wound wires, through the turns of which elements with eyes on their ends are threaded transversely. Connectors through the eyes fasten the mesh conveyor to the traction chains on each side, the chain links being fitted with strips having holes for this purpose. Operational reliability of the moving hearth is increased by fitting hooks between the eyes and the strips, with their ends bent round until they come together in a closed ring formation. These hooks can turn in both the horizontal and vertical planes. The transverse elements are made of two rods fastened together longitudinally, with the eyes actually formed on the ends of each of the rods.

Macaroni flour prodn. from wheat - by drying and heating grain to certain humidity and temp. prior to humidification
GRAIN PRODUCT PROCE 21.03.77-SU-464849
P41 (03.07.78) B02c-09/04

The macaroni flour can be produced from wheat by preparing the grain for grinding, removal of impurities, humidification, subsequent moistening and three stage grinding. The grain is ground using roller crushers and then the ground product is sorted into separate streams. To increase the highest quality and first quality product quality and its quantity, the grain prior to humidification is dried to 11.5-12.0% moisture content and is heated to 15-20°C.

GEFO- ★ D12 44244B/24 ★DT 2849-129
Texturised oil seed protein meat substitute - is prepd. by concentrating aq. fat-contg. oil seed dispersion, coagulating and thermo-fixing
GEN FOODS CORP 01.12.77-US-856468
(D23) (07.06.79) A23j-03 C07g-07

Texturised oil seed protein prodn. comprises concentrating an aq. dispersion of fat-contg. oil seeds, esp. full fat soyabeans, under conditions such that a noticeable protein denaturation is prevented, but sufficient water is removed to obtain a viscous dispersion having solids concn. > 30 (> 40) esp. 45-50 wt.%. The dispersion obtd. is pressed e.g. extruded, through a tool into an aq. bath. The protein [illegible] heated to harden and complete the coagulation of the protein present.

The prods. can be used as fibres or films, as meat substitute in traditional or new dishes. The oil need not be extd. from oil seed material before treatment. Carbohydrates need not be removed. 13.11.78 as 849129 (17pp 200)

LINK- D12 30193A/16 =GB 1547-339
Sausage casings peeling apparatus - includes guide, transporter, knife assembly and perforated wheel removing cut casings
LINKER MACH INC 10.12.76-US-749492
*(13.06.79) *ZA7702-544 A22c-11*

Peeling of casings from a string of sausages comprises advancing them past a slitting knife which produces a longitudinal cut. A perforated hollow member connected to a suction means is arranged downstream of the knife and removes the detached skin. A releasable guide is provided along the peeling path to guide the 'peeled' sausages out of the machine.

The appts. is of simple construction and thus easily cleaned. A wide range of sausage sizes can be treated. 27.10.77 as 044742 (7pp397)

INTT ★ D12 44536B/24 ★GB 2009-471

Optimising value of meat cuts produced from animal carcass - by making physical and quality measurements when animal is slaughtered which are fed to computer

ITT INDUSTRIES INC 05.12.77-US-857324

R27 (13.06.79) A22c-18 G06f-15/20

The value of cuts of meat produced from an animal carcass is optimised by making physical measurements of each carcass when the animals are slaughtered and feeding the measurements to a computer programmed to produce cutting in-structions for each carcass in accordance with data representing market conditions.

The market indicators are determined along with prodn. information when the carcasses are in a chilling dept. Carcass identification indicators are used to identify each carcass promptly after the slaughter.

Optimisation of cutting schedule in hog slaughtering plant. Relative profit or loss can be determined with respect to each carcass to tailor the buying procedures so as to achieve max. profit. Each carcass of a plurality to be processed in a time period is identified immediately following the slaughter of the animal and after it has been dehaired, singed and polished. The physical data is obtained at the kill dept. rather than the cutting dept. It is possible to program demand based on sales with respect to each cut already made or needed during a cutting process of the previous day. 30.11.78 as 046606 (28pp1044)

C03 (11.05.79) A23k-01/12

Prodn. of feed for ruminants comprises chopping up straw (or analogous material contg. lignocellulose) to pieces of max. length 0.1-5 cm, opt. grinding, then mixing with 1-10% NaOH and 0.5-5% oxidation catalyst at a moisture level of 10-20%.

The mixt is then vigorously mechanically milled at 60-100°C, and the prod. granulated. Esp. mixing is at 40-50°C for 10-40 min. and pref. oxidation catalysts are salts of Cu, Fe, Mn, Co, V, Cr or Ni. The starting material may be treated with 0.1-2% of an oxidant, e.g. a nitrate or permanganate, and 0.1-5% urea.

Digestibility and nutritional value are superior to thoseof other straw-based feeds. When added to feed concentrates at 35% a material derived from wheat straw provides 90% of the energy of barley. 4.9.78 as 025382 (9pp1251).

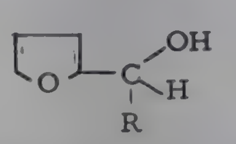
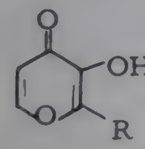
3-Hydroxy-4-pyrone cpd. prodn. - by reacting furyl:carbinol cpd. with halogen in organic acid or its alkali(ne earth) metal salt
SHINETSU CHEM IND KK 07.10.77-JA-120744
E13 (02.05.79) C07d-309
3-Hydroxy-4-pyrone cpds. of formula (I), useful as flavouring agents for foodstuffs and feeds, are prepd. by reacting a furylcarbinol cpd. of formula (II) with halogen (e. g. chlorine or bromine) in the presence of (a) an organic acid (e. g. formic acid, acetic acid, propionic acid, (iso) butyric acid, etc.) and (b) an alkali(ne earth) metal salt of an organic acid (e. g. sodium acetate, sodium propionate, potassium acetate, etc.), adding water to the reaction mixt. and heating. In the formulae, R is H or 1-7C monovalent hydrocarbon.



(II)



(I)

The reaction steps are very simple. Dangerous substances, such as peroxides, are not required. Pref. 3-15 mol. of (a), 2 mol of (b) are used per mol of (II); the reaction is at 0-50°C and the reaction system is pref. maintained under anhydrous conditions. 7.10.77 as 120744 (5pp140)

TOPP ★ D13 44933B/24 ★ J5 4055-748
Preservative compsn. for fruit and vegetable - comprises an adsorbent, e.g. bentonite; a hydrated ferrous salt; an alkaline cpd. and water or a sulphite
TOPPAN PRINTING KK 05.10.77-JA-119653
(04.05.79) A23b-07
The agent is composed ot (I) an absorbent composed of $\geqslant 1$ active carbon, bentonite, artificial zeolite, etc. (I) a hydrate of a ferrous salt, (II) an alkaline substance, (IV) water or a sulphite and opt. (V) a deliquescent substance (e. g. magnesium chloride) and/or an alkali metal carbonate (e. g. sodium bicarbonate).

(I) adsorbs ethylene, alcohol, etc., which vegetables and fruit gradually form during their preservation; (II) and (III) (e. g. calcium hydroxide) absorb oxygen through water and release water formed by the reaction. Thus the respiration of vegetables and fruits can be suppressed and the released water suppresses the evaporation of water from them. When they are under humid conditions, oxygen can be absorbed in the presence of sulphite or deliquescent substance, even under water-free condition. When alkali carbonate, such as calcium bicarbonate, is present, CO_2 gas is formed by the reaction which also suppresses the respiration of vegetables and fruits and the growth of mould. 5.10.77 as 119653 (4pp5)

NNTR ★ D13 44934B/24 ★ J5 4055-749
Processed food prepn. from plum kernel - by immersing the boiled, peeled and dried kernels in aq. soln. of sodium chloride, acetic acid, malic acid, citric acid, etc.
NIPPAN BOEKI KK 12.10.77-JA-123635
(04.05.79) A23l-01/21
The method comprises boiling plum kernels, peeling their inner skin, drying them to a moisture content $<50\%$, pref. 30-50% and immersing them in an aq. soln. contg. 20-30% sodium chloride, 0.015-0.045% acetic acid, 0.6-0.9% malic acid, 2.1-2.4% citric acid, etc.

Instead of the above soln., a commercial plum vinegar can be used. The soln. may also contain pigment, minerals, etc. The immersion is practiced for 5-10 days, and after the immersion the prod. is dried to a moisture content of 10%. 12.10.77 as 123635 (2pp5)

FUKO ★ D13 44935B/24 ★J5 4055-752

Packaging or casing material for fish paste, etc. - is prepd. by treating cellophane with hypochlorite and coating with aq. soybean protein soln.

FUJI OIL KK (OSAK-) 11.10.77-JA-122255
A92 (A11) (04.05.79) A22c-13 A23b-04/10 A23l-01/32

The method comprises using cellophane as the basic film, treating its surface with hypochlorite, drying, spreading aq. soybean protein soln. on it, and drying.

Adhesive between cellophane and soybean protein film is improved and the film is not separated by water, even after immersing the packaged foods in water at 80°C for 2 hrs.

Pref. the hypochlorite is sodium, potassium or calcium hypochlorite, used in an amt. of 0.03-0.1 g/m². The aq. soybean protein soln. may contain 1-6 w/w% plasticiser of glycerin and/or propyleneglycol to give a plastic property. The solution may contain pigment, other vegetable protein, animal protein and/or starch; and amt. of soybean protein is > 60 w/w% of protein and starch. 11. 10. 77 as 122255 (5pp5)

Spray freezing powder prodn. e.g. egg, from air injected fluid - in freezing chamber which vents air but collects prod. without diffusion

SOC FR TRANSPORT EN 07.09.77-FR-027113

(11.05.79) A23l-03/36

Cold air, or other suitable gas, is passed through a prim. circuit to freeze the prod. in a freezing chamber. Part of the wall of the freezing chamber is permeable to air but hot to the frozen prod.. A fraction of the air from the prim. circuit is compressed and employed in a high pressure, secondary circuit to spray-inject the prod. into the freezing chamber. Secondary circuit air is pref. passed through a cooling heat exchanger after compression and before spray-injection.

The permeable part of the freezing chamber wall is pref. made of very fine mesh screen, e.g. with a mesh size of about 20 to 30 microns. The freezing chamber pref. takes the form of a cylindrical drum rotating about a longitudinal axis inclined at an angle of between about 20° and 40° to the horizontal.

Used for spray freezing powders from fluids, partic. hole egg, eggwhite, egg yolk. Very rapid freezing can be achieved by accepting an extremely fine powder. This powder is retained in the freezing chamber and collected without diffusion difficulties. Air in closed circuits avoids prod. contamination. 7.9.77 as 027113 (11pp448).

Apparatus for refrigerating and cooking food - with valves to di single thermal exchange fluid through hot or cold reservoirs
SKALA S F 29.04.77-US-792455 (04.10.72-US-299294)
Q75 (29.05.79) F25b-13 F25b-29

Food is refrigerated in an oven where it is subsequently cooked. The oven includes a food processing compartment and a single enclosed chamber within the compartment. The enclosed chamber receives a single substan liquid thermal exchange fluid at hot and cold temps.

The food is placed in the compartment and the therma exchange fluid is cooled by a cold source separate from the oven. The cooled fluid is passed through the enclose chamber for a predetermined time to cool the food. The flow of cooling fluid is then stopped and the fluid is then heated to a hot oven temp. by a hot source separate fron the oven. The heated fluid is then passed through the chamber for a predetermined time to cook the food.

The appts. is used to store food at a low temp. until it is required to cook the food after which heat is applied within the same apparatus to either roast or bake the foo 29.4.77 as 792455 C.i.p. 3888303 (+4.10.72-US-299294) (6pp295)

Rotary valve feeding food treatment chamber - with two separa pocket areas with out of phase pockets
GENERAL MILLS INC 06.04.77-US-785140
(29.05.79) A23l-01/18

Food is processed in an appts. which includes an elongat treating chamber. The food is supplied from two separat sources and is fed to a continuously rotating device which has out of phase pockets for alternately transferring the food only from a single source at a time. The food is tra sferred during successively equal intervals of time between the equal intervals being equal to each other and of a duration considerably less than the equal intervals of time during which the food is delivered.

The appts. is used to introduce food material to an elongated treating chamber. The capacity of the treating chamber is increased. 6.4.77 as 785140 (11pp295)

Recycling and recovering rinsing water - from scowing workpieces for plating
DIDIER-WERKE AG 09.12.69-DT-961562
*M12 (07.06.79) *BE-754-457 +C23g-01/36*

In hot-tinning and hot-galvanizing processes a rinsing bath is inserted between a hydrochloric acid pickling bath and a fluxing bath contg. ammonium chloride. Rinsing liquid is circulated to a tank where acid taken over from the pickling bath is neutralised with a mixt. of ammonia and ammonium carbonate. The pH is adjusted to over 7(10) with this mixt. and the liquid passed to a separating tank. There iron hydroxide is removed and returned to the rinsing bath and liquid contg. ammonium chloride is passed to the fluxing bath. Fresh water as necessary is added to the rinsing bath.

The process is more economical as chemicals are recycled. 9.12.69 as 961562 (4pp068).

Aeration basin for sewage treatment
NEPTUNE MICROFLOC (NEP -) 06.08.69-US-847978
*(07.06.79) *US3511-380 C02c-01/06*

An aeration basin for sewage has in the centre a submerged cylinder, pref. contg. a backflushable graduated filter bed, at the bottom of which the clean water is extd. The cylinder is surrounded by a concentric partition, open at the bottom. The space between is filled by closely packed steeply inclined tubes through which the fluid must rise. Most of the flocculated sludge is separated in the tubes and drops back into the basin to increase the biological purification effect.

This continuous recycling raises the sedimentation efficiency for solids. 4.2.70 as 005052 (6pp39).

Device for separating solids from liquids - comprising a sloping apertured screen with liquid flow enhancing guides beneath it
TORAY IND INC 28.11.77-JA-141688
J01 (13.06.79) B01d-35/28 C02c-01/22
D/S: E(BE, DT, FR, GB, NL).

A device for separating solids from a carrier liquid comprises an apertured sloping screen down the upper surface of which the liquid/solid mixture runs. Secured to the underside of the screen are guide plates which enhance the flow of the liquid through the screen.

The plates depend in parallel fashion from the screen and the screen is preferably of the type comprising spaced parallel metal or plastics bars. In a preferred embodiment, the gap between the bars are kept clean by rotating brushes which are reciprocated across the undersurface of the screen.

The guide plates increase the rate of flow of the liquid along the underside of the screen and thus enhance the rate of liquid flow through the screen. Output is thus increased. The screen may be of use in separating the solid and liquid components of activated sludge.

Re-utilising ferrite obtd. from treatment of waste water - contg. heavy metal, by treating with heat in non oxidising atmos. adding hardenable material and kneading

NIPPON ELECTRIC KK 13.10.77-JA-123256
E31 (04.05.79) C01g-49

Heavy metals contained in a waste water are removed by either being taken in the lattices of the ferrite crystal or being adsorbed by the ferrite crystal particles is claimed. The ferrite obtained as a by-product is treated with heat under the non-oxidising atmos., then a viscous material (which can be hardened) is added and kneaded to make it electric wave absorbent or magnetic shield.

Specifically, the ferrite obtained from the process has particle size 600-1000Å, with ferromagnetism, and does not elute the heavy metals except in the acid solns. 13.10.77 as 123256 (3pp55)

KATA- ★ D15 45017B/24 ★J5 4056-245
Treating waste water of high COD content esp. sulphur components - by contact with metal oxide in acidic conditions and with a water soluble iron salt
KATAYAMA KAGAKU KOG 11.10.77-JA-122138
(07.05.79) C02c-05/04

A waste water having very high COD content, esp. sulphur components, e.g. Sx (x=2, 4, 6, 8, ····), $S_2O_3^{2-}$ and S^{2-} etc., resulted in contact with blast furnace slag, e.g. in land fill sites etc., is rapidly lowered in COD value by contacting with $\geq$ 1 metal oxide(s) from Fe_2O_3, Fe_3O_4 and MoO_3 under an acidic condition (pH $<$ 1.5). The treatment is pref. carried out under agitation, e.g. by mechanical means or by aeration.

The pH adjustment is carried-out with a mineral acid, e.g. HCl, HNO_3, H_2SO_4 and H_3PO_4, etc., and the amt. of the metal oxide is about 1,000 ppm w.r.t. the waste liquor having the COD value of about 1,000 to 1,300 ppm. The COD value is further lowered by use of a water-soluble iron salt, e.g. $FeCl_3$, etc. to precipitate the sulphur cpds. as iron sulphur. An oxidizing agent, e.g. H_2O_2 soln., hypochlorite etc. may be further used. 11.10.77 as 122138 (6pp34)

KOBM ★ D15 45018B/24 ★J5 4056-246
Decomposition of thiosulphate in liquor using sulphuric acid - obtd. from sulphur tri:oxide produced with recovery of sulphur and sulphate(s) and avoiding discharge of sulphur di:oxide
KOBE STEEL KK 12.10.77-JA-122746
E36 (07.05.79) C01b-17 C01d-05 C02c-05/02

In treating a thiosulphate-contg. liquor with an acidic liquor, e.g. H_2SO_4 to decompose the thiosulphate into elemental sulphur and sulphate, the improvement comprises treating the liquor with H_2SO_4 (94-97%) recircled from subsequent SO_3 to H_2SO_4 conversion step at a liq. temp. of 40-90°C and a pH of 0.5-3 to effect decomposition; treating steam contained in SO_2 generated in the acidic decomposing step with conc H_2SO_4 (94-97%) at 30-60°C to decrease humidity; oxidise the demoistured SO_2 to SO_3 in the presence of an oxidising catalyst; treating the SO_3 thus formed with the H_2SO_4 (94-97%) recirculated from the demoisturing step at 30-100°C to effect absorption and form H_2SO_4; and recovering elemental sulphur and sulphate from the liquor after neutralisation.

The process gives effective removal of thiosulphate by decomposition without discharge of SO_2 and without using a large amt. of H_2SO_4. 12.10.77 as 122746 (4pp34)

KOBM ★ D15 45019B/24 ★J5 4056-247
Removing sodium thiosulphate from liquors - in a three-stage process to produce elementary sulphur without discharging sulphur di:oxide
KOBE STEEL KK 12.10.77-JA-122747
E36 (07.05.79) C01b-17 C01d-05 C02c-05/02

In treating a thiosulphate-contg. liquor with an acidic liquor, e.g. H_2SO_4 to convert the thiosulphate into elementary sulphur and sulphates, the improvement comprises (a) decomposing the thiosulphate with H_2SO_4 in an acid decomposing vessel at 40-95°C and at pH below 3, to produce Na_2SO_4, sulphur, SO_2 and H_2O; (b) contacting SO_2 thus generated countercurrently with the thiosulphate-contg. liquor (thiosulphate concn. $>$ 0.3 g mol/litre) in absorbing tower at liquid temps. of $<$70°C and a pH (at the underpart of the tower) of 0.5-5 so as to be absorbed therein by the formation of polythionate: Na $S_2O_3(SO_2)x$ (x=1-1.5); (c) introducing the SO_2-absorbed thiosulphate soln. into a thermal reaction vessel wherein the polythionate is decomposed on reaction with $Na_2S_2O_3$ into sulphate and sulphur., and recovering the elementary sulphur and the sulphate thus formed, so that the thiosulphate is effectively removed from the system by use of a decreased amt. of H_2SO_4 without any discharge of SO_2 to be outside. 12.10.77 as 122747 (5pp34)

E36 (E17) (29.05.79) C02c-05/02 C05f-07

reatment of (industrial) effluent water contg. organic omponents comprises adding (1) H_3PO_4 and opt. HNO_3 in n amt. of at least 0.25 1/1000 1 until a distinct or strong cid reaction is achieved and (2) an organic acid chosen rom formic acid, acetic acid, oxalic acid, lactic acid or erivs. of these. After mixing, the effluent is neutralised vith lime water or quicklime (CaO) and the resulting ppte. s sepd. from the purified liq. phase.

The process is suitable for treatment of effluents from vashing installations, the paint industry, slaughterhouses, he food industry, municipal waste water, etc. The sludge produced is non-gelatinous and is easily dewatered, so hat sepn. of the sludge from the purified water is easier and uses less energy than prior art processes. The sludge produced is useful as an artificial fertiliser. 25.11.77 as 012984 (10pp513).

ESMI- ★ D15 45196B/24 ★NL 7713-116

Ultra- or hyperfiltration unit - with membranes on both sides of open/ended porous support tubes and hollow flange for hanging pipes and removing filtrate

ESMIL BV 29.11.77-NL-013116

(31.05.79) B01d-13 B01d-31

An ultra- or hyperfiltration installation is equipped with filtration membranes applied to both the inner and outer walls of open ended porous support pipes which are mounted in a hollow flange within the pressurised vessel. The hollows in the flange coincide with interruptions in the membrane to allow the weak soln. to flow from within the walls of the tubes into the flange hollow and thence via interconnecting ducts to a discharge connection. The joint between membrane and flange is sealed above and below the flange hollow to prevent communication between the high and low concentration fluids.

The bolts holding the clamping assembly for the flanges together are pref. hollow to allow a forced circulation to be maintained through the tubes and from the upper to the lower side of the flanges within the pressure vessel. The seal between flange and membrane is pref. effected by means of elastic 'O' rings compressed by the flange clamping assembly after insertion of the tubes.

Since both sides of the support tubes are used for the filtration, the yield for a given size of vessel and number

tration unit. 29.11.77 as 013116 (12pp1370).

UKRVODOKANALPROEKT 15.07.75-SU-156219

J01 (22.08.78) B01d-21

The proposed installation is used for processing suspension liquids, to separate the particles by precipitation, as used in mining installations for the by-product thickening of slurry tailings, subjected to preliminary flocculation during transportation from the concentration works to the slurry pumping stations, as well as in the clarification of water. The body has units to which the original liquid is fed and in which the residues are withdrawn and, in its upper section, there is a water-collecting container in the form of troughs with channels through which the clarified water is drawn off. The phase-separation quality is increased, due to the water intake spread-over being guaranteed, by fitting the troughs of the water-collecting container with vertical screens, forming sections, each of which is has a water-overflow and bottom screens which slope downwards in the direction the liquid is flowing. AMERICAN STERILISER CO 28.09.77-US-837320

P43 (29.05.79) B01d-13 B08b-03 B08b-09/04

Water from the rinse station of a dishwasher is stored in two heat insulated storage tanks each of which contains a heat exchanger. The water passes through the two storage tanks and to a reverse osmosis unit. The water is supplied to the reverse osmosis unit at a pressure of at least 400 psig.

A water mixer is positioned between the two storage tanks so that a controlled amt. of fresh make-up water can be added to the rinse water. The water mixer includes a temp. sensitive device for varying the amt. of make-up water added to control the temp. of the solution flowing to the reverse osmosis unit. The water passes from the reverse osmosis unit to an accumulator from where the water is returned to the rinse station via the heat exchangers in the two storage tanks.

The appts. conserves energy by the recycling of rinse water from a dishwasher. The apparatus produces sanitising rinsing without the use of chemical additives to produce a film-free and spot-free product. 28.9.77 as 837320 (7pp295)

Water treatment to remove suspended and colloidal solids - foam filter and gas injection

US SEC OF NAVY 30.05.78-US-910328

P41 (29.05.79) B01d-17 B03d-01

Suspended and colloidal contaminants are removed fro raw water by initially passing it through a multistage treatment to remove the suspended contaminants. Th sulting water is passed through foam to remove a port of the colloidal contaminants.

A gas is injected into the water which is pressurise for a time sufficient to allow the injected gas to dissol into soln. The water is depressurised to permit the di olved gas to bubble out of solution, the gas bubbles con tacting the remaining suspended and colloidal contamin to form aggregates which float on the surface of the wa to form a foam which is separated from the remainder the water.

The method is used to treat water to remove grit, s pended and colloidal solids of organic or inorganic mat microorganisms and surfactants. Specifically, it can treat brackish water, ground water or grey waste wate from laundry, shower and kitchen sources. The appara has a minimum of moving parts and uses a minimum of chemical additives. 30. 5. 78 as 910328 (7pp295)

Pneumococcal vaccine contg. capsular polysaccharide - obtd. highly purifying material from Streptococcus pneumoniae types

MERCK & CO INC 28.11.77-US-855491

B04 (13.06.79) A61k-39/02 C12d-13/04 C12k-05

D/S: E(BE, CH, DT, FR, GB, LU, NL, SW).

Vaccine effective against bacterial pneumonia comprise a physiological medium and a purified capsular polysaccharide of Streptococcus pneumoniae

(a) type 19 contg. 15-20% L-rhamnose, 5.5-8% D-glucos and 8-11% 2-acetamido-2-deoxy-D-mannose;

(b) type 23 contg. 31-38% L-rhamnose, 15-18% D-galact ose and 16-18% D-glucose;

(c) type 25 contg. 15-19% galactose, 15-19% glucosamin 7-9% galactosamine, 5-7% uronic acid, 2-4% fucose, 2-4 mannose and 1.8-4% D-glucose;

(d) type 72 contg. 27-32% glucosamine, 17-22% D-galact ose; 11.5-16.5% galactosamine, 5.5-8% L-rhamnose, 3- % fucose and 2.7-4.8% mannose; and/or

(e) type 73 contg. 29-34% glucosamine, 14-19% D-galact ose, 12-15% galactosamine, 2-5% mannose and 1.8-3.5% fucose.

The vaccines are effective against one or more types of Streptococcus pneumoniae as required.

Arthrobotrys robusta 'antipolis' strain - a new nematophagic fung for pest control in mushroom crops

INST NAT RECH AGRON 09.09.77-FR-027329

C03 P13 (11.05.79) A01g-01/04 A01n-15 C05f-11/08 C12k-01/

The microorganism Arthrobotrys robusta 'Antipolis', esp. the strain Pasteur Institute no. 1158-77, is a new nematophagic species. Process for controlling growth of nematodes in myco culture, esp. of the mushroom Agaricus bisporus, comprises introducing this new micr organism into the growing compost. Compost contg. 1

% A. bisporus and 1 wt.% A. rubusta 'Antipolis' is also med.

The 'Antipolis' strain produces 4 times more capture ans than the type, so is a more successful predator. s compatible with compost ingredients and does not bit the growth of the mushrooms. 9.9.77 as 027329 pp1251).

Sepn. of effective components in distiller's solubles (I), comprises (i) clarification of the con. (I) by centrifugation or filtration and (ii) drying the clarified soln. by spray-drying, freeze-drying, hot-air drying, etc.

(I) is waste water in whisky-distn. and grain alcohol distillation. After the step, (ii), (I) may be purified by molecular sieve-treatment, ultrafiltration and/or reverse osmosis. The centrifugation should be carried out with the revolution speed > 50,000 G and 1-10% of filtration aid should be added to the concentrate of (I) in filtration. 13.10.77 as 121910 (11pp42)

KOWA ★ D16 44944B/24 ★ J5 4055-782

Stable urokinase soln. - contains sulphate of sugar e.g. dextran to maintain activity for extended period

KOWA KK 06.10.77-JA-120338

B04 (04.05.79) C07g-07/02

Stable urokinase soln. contains a sulphate of sugars (specifically claimed dextran-sulphate, chondroitinsulphate, heparin, xylansulphate, glucosesulphate).

Urokinase used clinically in treatment of thrombosis is very sensitive to moisture, humidity, pH and concentration, and is sometimes inactivated in the course of prodn. (partic during lyophilisation). Addn. of the sugar sulphate to the urokinase solution stabilises urokinase to maintain the activity over a long period of time.

The sugar sulphates include naturally occurring sulphates of polysaccharides, sulphates prepd. by esterification of natural or hydrolysed polysaccharides, and sulphates of mono- or oligo-saccharides which are administrable to humans; e.g. chondroitinsulphates A, B, C, D and E, heparin, keratosulphate, heparitinsulphate, agarose, agaropectin, fuccoidin, charonin sulphuric acid, etc. 6.10.77 as 120338 (3pp52)

Purificn. of urokinase to give pyrogen free prod. - by contacting crude urokinase soln. with crosslinked agarose bound with carboxymethyl gp. and eluting adsorbed urokinase

TOA FOOD CHEMISTRY KK 07.10.77-JA-119985

B04 (04.05.79) C07g-07/02

Highly purified urokinase containing no pyrogen is produced from crude urokinase by contacting crude urokinase solution with a bridged agarose bound with carboxymethyl group, and eluting the adsorbed urokinase with a solution which has an electric conductivity higher than the crude urokinase solution does.

Urokinase industrially isolated from human urine usually contains pyrogen, thromboplastin-like substance, and blood group substance, and exhibits low specific activity (lower than 10,000 IU/mg, protein). This process provides an improved simple process for purifying crude urokinase on industrial scale. 7.10.77 as 119985 (4pp)

Methylenomycin A and B antibiotics - from Streptomyces violaceoruber No. 2416 effective against gram neg. and pos bacteria
SANKYO KK 20.07.71-JA-053700
*B04 (23.05.79) *J48019-796 +A61k-35/74 C12d-09/14*

.A new strain, taxonomically identified as Streptomyces violaceoruber No. 2416, is isolated from soil and found to produce 2 new antibiotics called methylemycin A (I) and B (II), which are effective against gram-neg. and gram pos. bacteria esp. against Escherichia resistant to chloramphe-nicol and tetracycline and Proteus. A strain of actinomy-cetes producing the antibiotics is grown by ordinary aero-bic culture in a medium contg. appropriate nutrients for the prodn. of the antibiotics. I is colourless, fat sol., and the acidic crystal with m.p. 110°. II is a colourless neutral oil. They are both easily sol in $CHCl_3$, esters of HOAc, Me_2CO, alcs., hardly sol in CCl_4, ether, and H_2O, and insol in petroleum ether and n-hexane. Salts of I are sol. in water. R_f values on silica gel chromatog. were 0.5 for I and 0.72 for II. Mol. wt. estd. my mass spectrog. was 182 for I and 138 for II. Mol. formula was $C_9H_{10}O_4$ for I and $C_8H_{10}O_2$ for II. 19.7.71 as 053700 C12d 9/14; A61r 35/74 (23.5.79) SANKYO CO LTD (7pp) (J4 8019796)

Microorganism cultivation automatic control system - with oxygen meters in air feed and spent gas discharge lines linked to comparator and controller

BREAD BAKING IND 11.11.76-SU-419628

(07.07.78) C12b-01/08

An automatic control system for microorganism cultivation, e.g. of yeast, in a medium containing molasses and nitrogenous salts includes an oxygen meter for air rising into the apparatus, a unit measuring the difference between this and the spent gas oxygen content, a unit determining the amt. of oxygen required for endogenous respiration and a comparator.

To improve biomass yield, oxygen meters are installed in the air feed and gas discharge lines and are connected to the difference unit, which is linked to one input of the second unit which also has an input from the incoming air oxygen meter and an output to the comparator which is connected to a programmed controller and with actuating mechanisms in the molasses and salts feed lines.

Use of the system in a yeast production plant raised yeast yield by 6%.

Electrically insulating vinyl chloride resin compsn. - contains carbohydrate to improve insulation in presence of plasticiser
HITACHI CHEMICAL KK 12.10.77-JA-122206
A85 E13 R41 (A14 A60) (07.05.79) C08l-05 C08l-27/04 H01b-03/44

The compsn. comprises 100 pts. wt. of vinyl chloride resin and 0.5-10.0 pts. wt. of carbohydrate. Pref. the carbohydrate is 1 of monosaccharides (e.g. diose, triose, tetrose, pentose, etc.), disaccharides (e.g. trehalose, saccharose, maltose, cellobiose, etc.) and polysaccharides (e.g. raffinose, gentianose, melezitose, starch, etc.).

By incorporating the carbohydrate, insulating property is improved even when a great amt. of a plasticiser is container for imparting softness and flexibility or mouldability.

If more than 10 pts. wt. of the carbohydrate is added, mixing is difficult in case of glucose or sucrose, and starch or cellulose cannot be melted but dispersed in soft vinyl chloride. The carbohydrate, as it has a number of adsorption points, comparably adsorbs ions dissolved in a plasticiser to decrease free ion concn. ascribed to leaking current. 12.10.77 as 122206 (4pp140)

Sweetening agent contg. invert sugar - produced by heating sugar soln. contg. sodium ultra:phosphate
OGURA J 01.04.70-JA-027695
(23.05.79) C13k-03

To aq. sugar soln. is added sodium ultraphosphonate i an amt. of 0.05-0.5% relative to the wt. of the sugar, -owed by heating, whereby the sugar in inverted to inv sugar.

A sweetening agent contg. mainly invert sugar whic has good taste and flavour can be obtd. at low cost. T aq. sugar soln. has sugar content of about 50-80%. T heating is conducted at 60-100°C for 5-100 minutes, e for 10-30 minutes. In an example to 70% cane sugar s is added 0.1-0.3% of sodium ultraphosphate and the mi is heated at 70-100°C for 10-20 minutes, whereby ≥ 5 of the starting cane sugar can be inverted into invert s ar. The resulting mixt. can be used directly as a swe ning agent without any processing. 1.4.70 as 027695 C13k 3/00 (23.5.79) OGURA J (5pp22)

ne cigarette is made up with a temporary filling material
king the place of the tobacco in the tube while the filter
is attached. The filling material is easily removeable
nen the time comes to insert the tobacco in its place.

In a pref. process of mfr., using a machine normally
nployed for making filter-tipped cigarettes, a continuous
ngth of paper tube is formed around a continuous length
temporary filling. The filled tube is cut into cigarette
ngths and each is fitted with a filter tip. The temporary
lling is pref. made of cellulose acetate fibres disposed
ngitudinally of the tube. The filling is pref. elastically
eformable in a direction radial to the tube and grips the
all of the tube elastically. The filter is pref. of the double or chamber type.

The fitting of filter tips can be fully mechanised on
achines used for making filter-tipped cigarettes. The
brous filling provides tube wall support normally forth-
oming from tobacco filling. 8.2. 79 as 874039 (9pp448)

n electro-mechanical safety system for a machine,
as a rotary processing roll on a fixed axis and a station-
ry pressure roller on a parallel axis which can be closed
n towards and moved back from the processing roll.
Displacement of the pressure roller is obtd. via a mechanical linkage from a reversible, high torque motor unit. The motor unit can be held under power at either end of its travel, i.e. with the roller advanced in its closed position or retracted into the open position.

An emergency, mechanical trip is located near to the nip of the roll and roller. When the trip is depressed, contacts are made in the electrical circuit so that the motor unit is driven to displace the pressure roller to the 'open' position. The pressure roller and its displacing linkage are pref. designed so that the roller falls by gravity to the open position when the motor exerts no torque, e.g. in the case of power failure.

Provides safety system for machines used for fleshing, scraping, depilating etc. of animal hides and skins partic. for the leather industry. The system is simple, reliable, inexpensive to fit and "fail-safe" in operation. System requires manual reset after tripping. 9.9.77 as 027553 (14pp448).

Dyeing leather in dappled patterns - by bonding stretched elastomer strips to back of leather using nitrile rubber-phenolic resin ardhesive to gather the leather, dyeing and rem
TAKAHASHI Y G 30.04.70-JA-037095
A35 F08 (23.05.79) B29d-07/20

Method comprises bonding stretched elastomer strips to back of leather using nitrile rubber-phenolic resin adhesive, releasing the stretch to effect gathering of the leather, dyeing the leather and removing the strips from the leather.

Method produces undyed spots on a dyed background, giving an attractive dappled pattern. In comparison with conventional methods, the method is simple and efficient, and does not leave thread holes in the leather. The method can be applied to natural and artificial leathers, as well as flexible synthetic resin sheets and other leather-like materials. 30.4.70 as 037095 B29d 7/20 (23.5.79) TAKAHASHI YG (3pp83)

MOGILEV MYASOKOMB 29.11.77-NL-013115
(31.05.79) C14b-01/02

Appts. comprises an initial wash and softening tank, a conveyor for removing the hides from the washtank to the dung removal and drying stage. The conveyor consists of two horizontal belts between which the hides are gripped and transported. The last stage comprises a chain conveyor which grips the hide along the longitudinal axis in the direction of motion, a series of rotating drums with combs set horizontally beneath the moving hide and inclined at an angle to give the max. contact surface, between each drum a water spray bar directed at the hide and finally a roller with scrapers which removes the moisture from the surface of the cleaned hide.

The chain conveyor consists of an upper chain with rubber pads which press against the smooth side of the hide and a lower chain with support plates on which the hairy side of the hide rests. Each drum comb is placed between an adjustable bar above the hide by means of which the distance of the comb tips from the hide can be precisely adjusted in accordance with the thickness of the hide. The ribs of the last roller are adjusted so that they are in contact with the hide and squeeze the water out of the hair. Water useage is minimised. 29.11.77 as 013115 (19pp1370).

Catalyst for curing polysulphide rubbers - consisting o carbonate, sulphur-contg. organic accelerator, and sulphur- complex
LONDON HOSPITAL 25.03.75-GB-012533 (17.03.75-GB-011
*A26 E33 (A60 E19) (13.06.79) *BE-839-668 C08k-03/26 05/36 C08l-81/04*

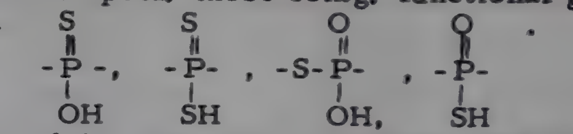
A catalyst compsn. used for the ambient temp. curin polysulphide rubbers, comprises $ZnCO_3$, an organosu contg. accelerator (I) contg. a disulphide linkage or a iocarbamate, and a sulphur/amine complex. Specific (I) is a thiazole or thiuram.

The obtd. rubbers are used e.g. as dental impress materials. The catalyst used is a non-toxic, gives di sionally stable prod. and does not impart an unpleasa taste. 16.3.76 (5pp982)

KURS ★ D21 44558B/24 ★J5 402
Adhesives for the hard tissue of animals - comprise cpds. c thiophosphorus gps. of mono basic acid, which, when mixed polymerisable monomers and cured exert greater adhesion
KURARAY KK 19.07.77-JA-087143
A96 E11 G03 (A81) (17.02.79) C08k-05/49 C09j-03/14

The new adhesives contain cpds. contg. thiophosphoru gsp. of monobasic acids, the adhesives have good adhe ence to the hard animal tissue.

Specifically, the cpds. contg. thiophosphorus gp. o monobasic acid are pref. those contg. functional gps., selected from



$$-\overset{S}{\overset{\|}{\underset{\underset{OH}{|}}{P}}}-,\quad -\overset{S}{\overset{\|}{\underset{\underset{SH}{|}}{P}}}-\ ,\quad -S-\overset{O}{\overset{\|}{\underset{\underset{OH}{|}}{P}}}-\ ,\quad -\overset{O}{\overset{\|}{\underset{\underset{SH}{|}}{P}}}-\ .$$

Representative of the cpds. are as follows: $HO(CH_2CH$ $C(=O)-CH_2CH_2C(=O)-NHCH_2CH_2NHP(=S)(-OH)-O-CH_2-C$ and (I).

(I) 
The cpds. are mixed with volatiliable solvents or po merisable monomers. When mixed with polymerisable monomers (e.g. methyl (methacrylate), ethylene glycol di(meth)acrylate) and cured by polymerisation of the m omers, they exert a larger adhesive power.

The adhesive are produced, e.g. by mixing the cpds with the polymerisable monomers, and curing the mixt by irradiation with UV rays or in the presence of the ca alysts contg. sulphinic acid or its salts (sodium benzen sulphinate). The amts. of the phosphorus of monobasic acids contained in the adhesives are 0.1-10 wt. %. The adhesive power of the adhesives reaches the max. in th thiophosphorus gp. amt. of 0.3 wt. %. 19.7.77 as 0871 (4pp136)

Multicoloured variegated soap mfr. - includes spraying colour soln. on moist soap particles and drying
COLGATE PALMOLIVE CO 06.02.78-US-875465 (06.10.75-US-619716)
(29.05.79) C11d-13/08

Multicoloured variegated soap bars are made by preparing a soap slurry contg. at least 30 wt.% water solidifying the slurry, reducing the solid to particles and applying a soln of colouring agent either before or after the reducing step The soap is then dried to a moisture content of 2-12%, conveyed to a plodder, and extruded to form continuous billets which are divided into bars.

The colouring does not spread through the soap, and cracking due to uneven moisture distribution is avoided. 6.2.78 as 875465 (4pp955)

GENM ★ D21 45639B/24 ★ US 4156-715
Chewing gum for reducing or inhibiting plaque - contains alkyl sulphate, di:(2-ethylhexyl) sulpho:succinate salt, zinc cpd., and plaque inhibiting flavour etc.
GENERAL MILLS INC 28.11.77-US-855125
B05 E19 (29.05.79) A61k-07/16 A61k-09/68

Chewing gum contains (all by wt.) 0.001-15% alkyl sulphate salt (I); 0.001-15% of a salt of di(2-ethylhexyl)sulphosuccinate (II); 0.0005-10% of butylated hydroxyanisole (III); 0.001-5% of a Zn cpd; 0.05-10% of a plaque inhibiting flavour (IV); and 10-95% of a gum base. (IV) is cinnamon, peppermint, or spearmint oil, or their mixts.

Chewing gum is highly effective in inhibiting or reducing dental plaque and calculus. Compsns. may also be mouthwashes, toothpastes, etc. 28.11.77 as 855125 (8pp478)

GENM ★ D21 45640B/24 ★ US 4156-716
Chewing gum for reducing or inhibiting plaque - contains gum base, di:(2-ethylhexyl) sulpho:succinate salt, and zinc cpd.
GENERAL MILLS INC 28.11.77-US-855126
B05 E19 (29.05.79) A61k-07/16 A61k-09/68

Chewing gum contains (a) 10-95% by wt. of a gum base (I); and (b) 0.001-20% by wt. of a mixt. of a di(2-ethylhexyl) sulphosuccinate salt (II) and a Zn cpd. (III). Wt. ratio (II):(III)=1000-1:1-1000.

Gum is highly effective in removing plaque from teeth and inhibiting the growth of new plaque. Compsns. are also mouthwashes, toothpastes, etc. 28.11.77 as 855126 (6pp478)

HUBE ★ D21 45641B/24 ★ US 4156-717
Tooth paste contg. silica thickener - prepd. by pptn. using controlled addn. of acid to alkali silicate soln.
HUBER J M CORP 12.10.76-US-731481 (03.10.73-US-402927)
E36 (E17) (29.05.79) A61k-07/16

A toothpaste is claimed contg. sorbitol or sorbitol-glycerol humectant and as thickening agent a pptd. silica having wet cake moisture ≥ 85%, oil absorption > 200cc/100g and surface area > 250 m²/g. The silica is prepd. by (a) providing a soln. contg. 10-20% alkali metal silicate, having an SiO_2/M_2O wt. ratio, 'x' of 1.0-4.0; (b) heating the soln. to 150-170°F; (c) adding a mineral acid at a constant rate of 1/x to 2/x moles H ions per min. to ppte. the silica.

Silicas prepd. as above are also useful as flatting agents in paints and varnishes. 12.10.76 as 731481 (+13.2.75-US-549619) (5pp955)

JOHJ ★ D21 45661B/24 ★US 4156-766
Thermally stable dental restorative material - comprises polyfunctional (meth)acrylate monomer and a para-tert. butyl:benzoyl peroxide catalyst
JOHNSON & JOHNSON 12.09.77-US-832304 (10.01.77-US-758277)
A14 (A96) (29.05.79) C08f-04/32 C08f-22/14 C08k-09/06

The material comprises a difunctional liquid polymerisable monomer and p-t-butyl benzoyl peroxide (I). The monomer is the bis(glycidyl methacrylate) of bisphenol A, triethylene glycol dimethacrylate, the trimethac or triacrylate of glycerol, trimethylolethane, trime propane or trimethylollantane or diphenyloxide subs by 1-4 $-CH_2OOC-C(CH_3)=CH_2$ gps. The compsn. is ed when free of accelerators for the catalyst or in c bination with an amine accelerator.

The materials are used for filling teeth or as de glazing cpds. or dental cement. (I) gives increased mal stability of the monomer/catalyst compsn. (fre accelerator) of 2 years at 70°F. 12.9.77 as 832304

SODR- ★ D22 44035B/24 ★BE -872-554
Feed arrangement of continuous sheets of pulp to dry-laying machine - in zig/zag folds
SODRA SKOGSAGARNA 30.05.78-SW-006233
F09 (06.06.79) D21b

In the grinding of fibrous wood pulps in the conventional grinders, using hammer, needles or saw-teeth etc., to obtain a dry-laid web of pulp flakes, for the prodn. of paper and absorbent prods., such as napkins and diapers, the pulp is fed to the grinder in the form of a zig-zag continuous sheet.

By folding, rather than winding the continuous sheet, it is possible to establish an uninterrupted feed, without the need to change the roll or bale. On re-instalment after feed breakdown, it is not necessary to consider the peripheral speed of the unwinding roll when re-establishing the delivery. An economy is effected since there is no need to install a device for changing spent rolls or bales. The folded web may be fed to machines previously intended for rolls of pulp. It occupies less space than the rolls and costs less to transport. It is possible to provide a day's supply to the web feed device, without need for replacement. Changing the folded web bales is quick and simple. 6.12.78 as 872554 (21pp1359)

Sodium tri:poly:phosphate for detergent slurry use - prepd. by adding oxidising agent to impure wet process phosphoric acid before concn.

HOECHST AG (KNAP) 05.12.77-DT-754020

E34 (13.06.79) C01b-25/40

D/S: E(BE, CH, DT, FR, GB, NL).

Sodium tripolyphosphate is prepd. from organic impurity-contg. wet process phosphoric acids neutralised up to the corresponding Na : P mol. ratio, which are concd. from P_2O_5 contents <20 wt.% to 27-32 wt.%, by spraying the orthophosphate solns. or suspensions obtd., in the presence of oxidising agents, in a single step, into a fuel gas-heated spray-tower at 300-500°C. Novelty consists of adding the oxidising agents to the wet process phosphoric acids before concn.

The product is used as builder in the prepn. of detergent slurries and has a suitable hydration behaviour, i.e. in hydration test, (ROH), the prod. causes a temp. difference $\geqslant$ 7°C between the temp. measured after 1 min. and after 5 min.

4.12.78 as 101544 (14pp200).

Detergent tablet contg. core of alkaline builder - coated with molten hydrated salt, esp. for automatic dishwashers

PROCTER & GAMBLE CO 15.02.78-GB-006004 (29.11.77-GB-049614)

A97 E34 (13.06.79) C11d-03/39 C11d-17

D/S: E(BE, DT, FR, GB, NL).

Detergent tablet has a core of alkaline builder salt (I) and a coating of hydrated salt (II) of m.pt. 30-95°C (esp. 30-75°C) which has been applied as a melt.

Specified (II) are hydrated Na acetate, metaborate, orthophosphate, Na_2HPO_4, NaH_2PO_4, Na-K tartrate, K-Al sulphate and $CaBr_2$, esp. a 3 : 1 - 1 : 3 w/w mixt. of Na acetate trihydrate and Na metaborate tetrahydrate.

The molten (II) may include, in suspension, an organic liq. (esp. a nonionic surfactant or silicone suds suppressor) sorbed on a carrier.

Used esp. in automatic dishwashing machines.

Coatings are easily applied, do not interfere with cleaning action and are dissolved completely and quickly.

16.11.78 as 200307 (19pp1251).

BATT ★ D25 44432B/24 ★EP ---2-423

Automatic washing machines - with integral electrolytic peroxide generators, for efficient bleaching action without subsequent pollution problems

BATTELLE MEMORIAL 06.12.77-CH-014876

E36 F06 J03 (13.06.79) C01b-15/02 C25b-01/30 D06f-35

D/S: E(BE, CH, DT, FR, GB, IT, LU, NL, SW).

An automatic washing machine is fitted with appts. for generating hydrogenperoxide ions in situ for release into an aqueous wash when required to act as a bleaching agent. The ions are generated electrolytically in alkaline solution by reduction of oxygen at an alkaline cathode.

Eliminates use of relatively unstable prefabricated peroxide reagents added either separately or premixed with detergent. Generates less of a persistent environmental threat via wash waste by-products than use of perborate bleaching agents, and is effective at lower water temps., i.e. < 80°C, reducing the thermal energy necessary for effective combination of washing and bleaching clothes. Separate generation for injection after the start of the wash can avoid premature deactivation of co-reagents in the detergent preparation used, e.g. enzymes. Freshly generated hydroperoxy ions are more effective cleaning and bleaching agents by a factor of about 5, than inhibited substituted peroxides used in premixed detergent compositions required to be suitable for storage prior to use.

An expandable compressed reticulated polyurethane foam article is impregnated with and bound in its compressed state by a fabric softener of softening pt. >38°C and being water dispersible at 20-85°C. The article is used in a claimed process for conditioning fabrics in a wash or rinse cycle of an automatic washing machine.

The foam articles may be compressed sheets or wafers of thickness 0. 01-0. 25 inches that are easily packaged and stored. In use, they slowly return to their original form with a slow release of fabric softener from the foam in amts. of 80-100%. 24. 7. 78 as 927211 (5pp966)

CPI INDEXES

ERTING PATENTEE INDEX (II)

ly by section and overall, lists all current patents in
tee code order and, within a given patentee, in earliest
ty date order. The first line gives patentee code,
st priority date, patentee name, CPI classes and finally
urrent patent number. The second line gives the first
of the title, followed by the accession number.

BASIC PATENTEE INDEX (X)

Weekly by section in BAJ only. Entries under any given patentee code heading are in earliest priority date order. The title, truncated to 105 characters, is followed by the accession number and current patent number. The last line of each entry consists of the patentee name, the priority details (earliest then latest if there is more than one) and finally the Derwent classes. This index is cumulated quarterly and annually by section as hard copy. Overall A—M cumulations of from a quarter up to 5 years are available as COM.

MANUAL CODE INDEX IN Basic Abstracts Journal only

At the start of each main group of codes, the manual code and its descriptor are printed in the middle of the column. Each sub-division of a manual code group appearing during the week is given, accompanied by its descriptor. All manual codes occurring during the week within each sub-division are then listed, with accession numbers posted against them.

In all there are about 3,600 manual codes in CPI, each one having an average of less than 200 documents assigned to it per year. The full classification is set out in the Manual Code Instruction Manual, which also contains a keyword index of terms for easy reference.

APPENDIX 1

COUNTRY COVERAGE

"Major" Countries

Covered completely in CPI and WPI from the commencement of the service except: Research Disclosure 1978, Europe and PCT 1979, Sweden transferred from "Minor Countries" 1979. Average weekly numbers are listed alongside.

Fast publishing

Belgium	180	
Europe	150	
France	740	
Germany, W. unexamined	1050	
Japan unexamined	845*	
Netherlands unexamined	240	
PCT	40	
Research Disclosure	20	
South Africa	100	
Sweden	260	
United Kingdom unexamined	600	3325

Czechoslvakia	180	
Hungary	35	
Israel	40	
Italy	155	
Rumania	25	560

MINOR AND MAJOR COUNTRIES

If the first publication of an invention takes place in one of the 'major' countries listed above, then this publication is called the basic patent, a WPI accession number is assigned, and this is used for all subsequent members of the family.

If, however, the first publication occurs in one of the 'minor' countries listed above, then the document is regarded as a provisional basic. No accession number is assigned, since an abstract is not provided. If this provisional basic is then followed by further family members also from 'minor' countries, these produce entries in the same indexes even though an accession number has still not been assigned.

However, as soon as a member of the family is published in one of the 'major' countries, then this is regarded as the first disclosure. An accession number is assigned, and will apply also to all the earlier members of the family (from the 'minor' countries). Hence it is possible to see, in Index V, entries where the basic has a later week number than some of its equivalents.

For CPI, if the first publication occurs in Sweden, South Africa or Japan — in the case of Non-Japanese nationals — then the document is treated as a provisional basic as outlined above. Other than for Japan where a heading is given, an Alerting abstract is included in CPI at this stage.

Subsequently, when a documentation abstract is available an accession number is assigned to the document and the abstract published in the BAJ and related products. Headings will be included in the Alerting Bulletins for Sweden and South Africa together with abstracts for the Japanese at this later stage.

Entries are included in WPI Gazettes at both stages. At the later stage both a basic and an equivalent heading will be given for each such patent number.

COUNTRY CODES

For patent number (not priority) purposes, DS distinguis accepted West German specifications (DAS) from unexamined applications (OLS) which are given the nor DT code. in the case of Japan J5 represents unexamined applications, and J7 the examined of present series.

Arrangement of Abstracts

See Appendix I for definition of 'Major' and 'Minor' Countries.

'MAJOR' COUNTRIES – An alerting abstract of every basic and examined equivalent document is provided except for equivalents from Canada, East Germany and Switzerland. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

See inside cover for further details.

ry prods. and esp. small crusty cobs are produced in
class condition and oven fresh without any detectable
of quality by the consumer. The cobs with which stale,
, warmed-up articles cannot be compared are from
ded dough raised bacterially, at a suitable tempera-
and baked immediately afterwards.
his preliminary baking is carried out so that whilst
goods are well done, there is no crust formed. The
s are then deep-frozen and only baked to give a crust
ediately before eating.21.9.72 as 246214(5pp1045)

/ ★ D11 45775B/25 ★DT 2754-459
d, mechanical prodn. of pastries, esp. cakes - using two
ing surfaces to form rolled up dough layers with fillings
MRICH E 07.12.77-DT-754459

gh for heavy pastry prepn. - using beta-fructofuranosidase
yme to weaken cohesive strength of gluten and facilitate
cessing
KAZGIPROPISHCHEPROM 11.03.77-SU-461852
D16) (17.07.78) A21d-08/02

ermediate product for the prepn. of heavy pastry,
imed in Parent Patent 431853 is prepd. with use of β-
ctofurnosidase.
This process is improved by using ferment prepn. 'Protosubtilin G 10X' (RTM) having high content of β-fructofuranosidase whereby the cohesive strength of gluten is reduced and, hence, the kneading of the dough is accelerated (up to 4 times), and the rolling and laying aside of the dough is shortened or completely eliminated. The 'Protosubtilin' prepn. is introduced pref. in an amt. of 0.01-0.02 wt.% (w.r.t. the flour) during the prepn. of the dough after the introduction of the flour.
Sevryukova, G.F., Vitevskaya, A.V., Musienko, N.D. et al. Bul. 32/30.8.78. 11.3.77. as 461852 Add to 431853 (5pp70)

INTT D11 08604A/05 =US 4157-403
Microwave baking partly baked bread rolls - to reduce baking time and packaging in hot shrink foil
INT TELEPH & TELEG CORP 12.07.76-US-704270
*(05.06.79) *DT2729-241 +A21d-06*

Brown and serve rolls are processed by preparing a dough, forming the individual rolls, placing the rolls in sales cartons, proofing the rolls for 7-12 mins., utilising microwave energy of frequency 9.15 MHz and flux density 11-34 watt hours per lb., and baking rolls for 4-6 mins. by similar means. Pref. the baked rolls are wrapped, while hot, with a shrink film and then passed through a heated shrink tunnel.

Prodn. time by microwave process is less than by conventional methods. Baking is effected in the sales carton eliminating the need for handling and transfer. Shelf life of prods. are increased. 12.7.76 as 704270 (3pp931)

Substitute for chlorine-bleached flour - comprises heat treated unbleached flour and partially swelled starch
US SEC OF AGRICULTURE 15.02.77-US-768917
(05.06.79) A21d-02/36 A21d-06

A flour-starch mixture suitable for making high sugar content baked goods is prepd. by (a) heating unbleached wheat flour to 49-93°C. for 1 hr. to 10 weeks; (b) mixing starch with water and heating the slurry to 54-71°C. for sufficient time to cause swelling of starch granules without fragmentation; (c) mixing 3-15 pts. treated flour with 1 pt. of the recovered starch.

Baked goods prepd. from the mixt. have good volume, grain, texture, colour and eating quality, comparable with those obtd. using chlorinated flours. The process does not use noxious chemicals, and the product can be marketed in countries where bleached flour is banned. 15.2.77 as 768917 (4pp955)

Appts. for sepg. bone structure from fish - cuts off passable parts from spine and tail fin SW 26.3.79)
NORDISCH MASCH R BAADER 29.08.77-DT-738845
(13.06.79) A22c-25/16

Those parts of the bone structures of filleted fish which are capable of passage, are removed mechanically by a pair of cutting tools rotating in a vertical plane and separated horizontally from each other by a gap of predetermined size.

In front of the cutting tools there is a feeder surface arranged horizontally or inclined, reaching towards their points of action. The feeder surface is formed by two flat surfaces joined by a ''V''- of ''U''- form depression which opens into the gap between the cutters. Above the feeder surface before the cutters a pair of guide discs which can be rotated, are fitted. Their undersurfaces subtend an acute angle to the flat feeder surfaces, and their closest approaching circumferential points extend into the depression, and lie close to the guiding edges of the two flat surfaces, turning in the direction of motion.

Used for sepg. the side sections of the fish skeleton from the spinal column. The machine takes the bone structures of the filleted fish in quick succession, whilst guiding the spine and the tail fin automatically. The bone frameworks can be fed forward irrespective of their nature since the tail fin has a constant surface and the spine fits in the depression. 29.8.77. as 738845 (13pp1045)

Waste blood deodorisation and conversion to animal
fertiliser - by mixing with synthetic wollastonite and sulph
allowing to coagulate, and drying
RACK ENG KK 18.10.77-JA-124015
C03 (C04 D13) (15.05.79) A23k-01/04 C05f-01

In a method for composting waste blood, e.g. from
slaughter houses, fish markets, etc. 100 pts. wt.
blood, 0.1-50 wt. pts. of synthetic wollastonite, a
100 pts. wt. of sulphuric acid (98%) are mixed, pr
manner in which conc. sulphuric acid is gradually
ed onto waste blood until pH ⩽ 4.0 to release gase
ent in the blood and then synthetic wollastonite is,
sufficient stirring, added to the waste blood gradua
while stirring, then the waste blood sotreated is al
after5-20 mins. more stirring, to stand in another
tainer until the whole of the waste blood is coagula
a jelly state, and lastly the coagulated waste blood
dried, by heating or exposing to sunlight, to a pow
state.

Method shortens the water vaporisation time wh
ing by heating or under sunlight to 1/2-1/4 day com
to untreated waste blood, and also improves deodo
of waste blood. The gelled waste blood powder, ca
used as fertiliser or animal feed. Method is esp.
in the amino acid, starch, milk and fishery industr

Shortening of the vaporisation time can also be
by the addn. of an inorganic salt, e.g. borax, etc.,
alkali metal peroxide, e.g. sodium peroxide. 18.1

*(05.06.79) *US3989-851 A23b-04/02 A23l-01/27*

A meat prod. is prepd. of the type where a liq. medium is prepd. contg. a nutritional protein isolate, water and curing salt, stitch pumped into natural meat muscle tissue and allowed to cure.

Liq. medium is prepd. by first hydrating ≥7 wt.% w.r.t. medium, a salt tolerant protein isolate which forms a gel upon heat setting in water; then admixing the curing salts; then stitch pumping the meat tissue with medium to 140-165 wt.% w.r.t. its green wt.

Upon curing, the medium cooks to a uniformly distributed meat-like gel. The extra pumped meat prod. maintains the same nutritional protein value and identical textural properties of natural meat tissue. The protein retains its hydrated form in the final prod., and there is no protein separation. 25.5.78 as 909598 Reissue of 3989851 (+26.8.74-US-500219) (3pp931)

dy for pompholyx - comprises eggs having high organic iodine
nt
MIMAE H 14.10.77-JA-122470
4 C03 (B06) (12.05.79) A61k-35/54

edy for pompholyx comprises as main component, having a high content of organic iodine. The egg is uced from birds (fowl) to which calcium iodide has administered. The eggs may be those of chickens, , Japanese quail, guinea fowl, etc.

dministration of calcium iodide to birds may be carr- out by blending with the feed. Suitable amt. of the tance is > 10 mg as iodide per kg of feed, pref. 75- mg per kg of feed. Iodine content in conventional s is 10-30 μg per egg. When calcium iodide is admin- red for example to chickens, eggs contg. 200 μg per after 5 days are produced. Pref. iodine content in s is > 100 μg per egg, partic. 200-1000 μg per egg. 10.77 as 122470 (2pp69)

Water-swellable dried food of high protein content - prepd. by freeze-drying a mixt. of vegetable protein, fat, water and swelling agent
AJINOMOTO KK 18.10.77-JA-124690
(12.05.79) A23l-01/20

Dried food (I) of high protein content is prepd. by freeze-drying a mixt. (II) of 10 wt. pts. of vegetable protein and/or albumin-contg. animal protein, 2-40 wt. pts. of fat, 30-140 wt. pts. of water and 0.01-5 wt. pts. of swelling agent, such as glycerin, propylene glycol and sorbitol.

(I) can be swelled easily with water and changes to a soft soy bean curd-like (Tofu) food. Specifically, after pH of (II) is adjusted to 6.0-8.0, (II) is agitated to prepare em-ulsion. The emulsion is frozen at -50 to -10°C, e.g. (-40 to -20°C) and dried, opt. after treatment at 50-150°C. Ascorbic acid, alginic acid, polysaccharide, emulsifier and other additives may be added to (II). 18.10.77 as 124690 (4pp 42)

Food refrigerant compsn. - comprises propylene glycol aq. soln. contg. di:sodium glycol and/or nicotinic acid amide
ASAHI GLASS KK 21.10.77-JA-125810
E17 G04 (E13 E34) (14.05.79) C09k-05

The compsn. consists of a propylene glycol aq. soln. contg Na_2HPO_4 and/or nicotinic acid amide. The propylene glycol aq. soln. contains 20 to 60 wt.% of propylene glycol. The amt. of phosphate to be added is 0.1 to 1 pt. wt. to 100 pts. wt. of the propylene glycol aq. soln. and the amt. nicotinic acid amide to be added is 0.001 to 1 pt. wt. to 100 pts. wt. of the porpylene glycol aq. soln. The pH value of the compsn. is adjusted to 9 ~ 12.

This compsn. is used to cool food directly as it is safe as food additive. The compsn. does not corrode cooling pipe.

In an example, 0.3 pts. wt. of Na_2HPO_3 was added to 100 pts. wt. of a 60 wt.% propylene glycol aq. soln. to prepare a refrigerant compsn. 21.10.77 as 125810 (3pp)

Dithionite deoxygenating compsn. contg. fibrous material - is used for preserving food, preventing oils and fats from rotting and preventing oxidn. of metals, chemicals, etc.
MITSUBISHI GAS CHEM IND 15.07.76-JA-084168
*E36 M14 (D23) (30.05.79) *J53010-377 B01d-53/16 B01j-02/22*

The compsns. comprises 100 pts. wt. of deoxygenating agent, composed mainly of dithionite salt, admixed with 1-50 pts. wt. fibrous material. The deoxygenating agent is composed mainly of dithionite along with e.g. water, alkali metal and activated carbon as well as alcohol. The fibrous material is e.g. pulp, cellulose, etc. pref. in powder form.

The compsn. can be easily tabletted with increased physical strength smoothness and improved appearance. The tablets are easy to handle, have good oxygen adsorption and do not accumulate heat produced during deoxygenation. 15.7.76 as 084168 B01d-53/16, B01j-2/22 (30.5.79) MITSUBISHI GAS CHEM IND (5pp)(J5 3010377)

CEPA D13 38857W/23 =SU -436-905
Preventing caramelization of vegetable hydrolyzates - by adding sulphite lye or analogous concentrates to increase safety and effectivity
CELLULOSE PAPER IND RES 19.05.72-SU-788445
*F09 (D16) (17.07.78) *SU-436-905 C13k-01/02 D21c-03/02*

Caramelisation of hydrolysates obtained by hydrolysis of vegetable matter in e.g. a sulphate lye can be prevented by addition of a concentrated sulphite lye. The effectiveness of this method can be enhanced by introducing the sulphite lye concentrate during the hydrolysis process. Pref. a sulphite lye concentrate is introduced in an amt. of 0.03-0.07%; alternatively, a concentrate of a sulphite-alcohol liquor or the liquid remaining after the yeast cultivation is used in an amt. of 0.03-0.04%.

The concentrate is added directly to the water used for the hydrolysis process, e.g. hydrolysis of wood. The amt. of the solids in the concentrate is 2.5-4.0 kg. per ton of dry cellulose (after the cooking). The hydrolysis can preceed the sulphate cooking.

Cheese salting installation - with rows of trays above one another in frame with perforations, to allow brine to flow round and through each tray layer.
BUTTER CHEESE IND 04.11.76-SU-418050
P13 (02.08.78) A01j-25

Device for salting cheese, comprises trays mounted above one another on a base plate. The trays have perforated bottoms and there is a sprayer and a brine recirculation system. The brine is more uniformly distributed over the surfaces of the cheeses by providing a container with rows of horizontal guides for the trays, with the bottom of each tray made as two plates a short distance apart. The top one has complex perforations while the bottom one is provided with uniformly distributed hemispherical depressions with through holes. The container for the trays is one of several inside which the trays are arranged. The assemblies are placed underneath the sprayer and the brine is poured over them.
